South 24 Parganas: An Overview

1.1 South 24 Parganas: An Overview

The district of South 24 Parganas came into existence on March 1, 1986. Prior to that date, it was a part of undivided 24 Parganas. The large undivided district of 24 Parganas was bordered by the Bhagirathi channel in the West, Bangladesh in the East, the district of Nadia in the North and the Bay of Bengal in the South. This huge and populous landmass was under the same administrative jurisdiction from the beginning of the British rule in Bengal.

After the fall of Nawab Siraj-ud-Daulah, Mir Jafar, the new Nawab, concluded a treaty with the English East India Company on the 15th July 1757, by which the former ceded to the Company the Zamindari rights of 24 mahals. It was recorded that ‘all the land lying to the south of Calcutta as far as Kulpi, shall be under the Zamindari of the English company; and all the officers of this Zamindari shall be under their jurisdiction.’ These 24-mahals, or 24 parts, were given the name 24 Parganas.

By the time of the Permanent Settlement in 1793, the Sundarbans had been included in the 24 Parganas’ administration. Finally, in 1986, the district of 24 Parganas was divided into two separate parts mainly for reducing the administrative burden. The southern part came to be known as South 24 Parganas.

South 24 Parganas encompasses the moribund, mature as well as the active parts of the Gangetic delta. The rich arable lands of the South 24 parganas district consists of the southern plains to the south of Calcutta between the old and present courses of the Hooghly. Due to its peculiar geographical location and the dictates of geography, the means of transport and communication in this region are not well developed, with all the attendant consequences. Lack of irrigation has meant mono-cropped agriculture. Breaches in earthen embankments and cyclonic storms mean loss of life and destruction of crops and property on a regular basis. Any development strategy in this ecologically fragile environment must be carefully designed and implemented.
The present South 24-Parganas district forms the southern-most part of the deltaic plains of Bengal. This is a relatively new land, emerged from the alluvial deposits of the Ganges and its various tributaries. In the very recent period, the archaeologists have found some pre-historic artifacts from the surface of this region. But these evidences are still not sufficient to write a definite pre-history of this particular area. This is also true for the early historical period of this region. From the first century B.C. we have found some foreign literary accounts about this region, which indicate the existence of a land of prosperous people in this part of Bengal. But this is a land where there have been constant shifts in the courses of rivers. Therefore, it is unlikely to find the supportive detailed archaeological evidences, in absence of which the early history of this part of Bengal remains speculative.

The Greek writers, from the first century B.C. onward, mentioned the people of this region, often referred to as the Gangaridae, Gangaridai, and Gangaridi etc. According to Ptolemy, the famous second century geographer, the country near the mouth of the Ganges was occupied by the Gangaridai. He also mentioned that they were different from the people of the territory of Tamrolipta, called Tamalites. It may be assumed that the whole deltaic Bengal between the Bhagirathi-Hooghly in the west, the Padma-Meghna in the east and the Ganga-Padma in the north became the land of the Gangaridai people. The district of South 24 Parganas as of now falls within these limits.

From the Greek sources, we know that the country of the Gangaridai was a prosperous one and this prosperity was largely depended upon its profitable foreign trade. There was a famous port-city, called Ganges. This city was situated on the confluence of the Ganges with the sea. Through this port, according to The Periplus of the Erythraean Sea, a travelogue written by an anonymous Greek sailor of the first century A.D., a considerable amount of trade used to be carried out in betel, spikenard, pearl and maslin. In this profitable foreign trade, gold coins were used as the medium of exchange.

Where was the city of Ganges located? Historians are confused. It might have been in the present Sagar island, or at Chandraketugarh of Deganga (Deganga means dwi or dwitya Ganga, second mouth of Ganges) which presently is in the district of North 24 Parganas. Another possible place is Atghara near Baruipur, situated on
the east bank of the old course of the Bhagirathi, called Adiganga.

The establishment of the Gupta Empire marks the end of the political isolation of the various independent states that flourished in Bengal. This part of Bengal, also, got incorporated in the Gupta Empire, though the actual effectiveness of their rule in this area remains uncertain. From indirect archaeological evidence it seems that the Gupta rule made a deep cultural impact on the district. The imperial Guptas were the patrons of Puranic Brahmanism. Through them Puranic Brahmanism and its associated culture spread over this region. A large number of terracotta icons of Puranic Brahmanical Gods and Goddesses have been found from the Berachampa-Deganga-Chandraketugarh region and from Atghara. Some Buddhist icons have also been found.

This part of Bengal remained outside the effective hegemony of the Gauda kingdom of Sasanka. It was under the sway of the Pala Empire. During the reign of Gopala II and Vigrahapala II (circa A.D. 940-988) the Palas lost a large portion of their territory in Vanga to the Chandras, who started their career as a feudatory of the former. There is still a brick temple, popularly known as Jatar Deul, standing at the village of Uttar Jata of Mathurapur, which was constructed by a certain king named Jayanachandra in 975 A.D., which confirmed the fact that this area was under the sway of the Chandra rulers. It is interesting to note that all the remnants found from the surrounding area represent Puranic Brahmanical tradition, not Mahayani Buddhist tradition, which indicates that the Palas were unable to imprint their own image onto the culture of this region. In the Sena period this tradition is not only continued, but strengthened. It is well known that the Senas were the patrons of Brahmanism. By issuing land grant to the Brahmanas, they wanted to extend their hegemony over the rural folk. This kind of activities from the part of Senas had other consequences also. As a result of the regular settlements in the Sundarban regions, the agricultural economy was spreading more and more towards the south.

From the ancient times till the sixteenth century at least, there were many janapadas which emerged on the banks of old Bhagirathi channel. Kalighat, Boral, Rajpur, Mahinagar, Baruipur, Bahadu, Joynagar, Majilpur, Chatrabhog were some among them. Bipradasa Pipalai’s Manasavijaya, composed in A.D. 1495, provides us with a list of names of some important villages and towns of this region. Baruipur was a populous city in the late fifteenth and early sixteenth century. Chandsadagar, a merchant character of Manasavijaya, reached
Baruipur, from Kalighat, through the old Bhagirathi channel. From there he proceeded towards Chatrabhog, and then traveling through Hatigarh pargana reached the open sea. Chaitanyakadeva (1486-1534), according to his contemporary biographies, also went through this route. In his journey towards Puri, through the Bhagirathi channel, he halted at the village of Atisara, near Baruipur. His last stoppage in 24 Parganas was at Chatrabhog, now a village within the jurisdiction of Mathurapur police station. Chatrabhog seems to have been an important river-port on the old Bhagirathi Channel. The zamindar of Chatrabhog, Rama Chandra Khan, helped Chaitanyakadeva in his onward journey to Orissa. Chaitanya’s journey along the east bank of Bhagirathi, and this kind of association with the influential landlords boosted the spread of Gaudiya Vaisnava Bhakti movement, at least on the riparian tracts of the 24 Parganas district.

A retrogressive process might have been started from the middle of the sixteenth century onward. These hitherto burgeoning centres of northern Sundarban areas and the Bhagirathi-Hooghly received setbacks. There were two reasons. The first was the rampant activities of the Portuguese free-booters and others. The second was geographic, the eastward trend of the Ganges dramatically intensified after the late sixteenth century, and hence it gradually abandoned the old Bhagirathi channel, presently known as Adiganga. So long as the river flowed smoothly, the life of the surrounding areas also flowed. When the river became moribund, the thriving centres of life were affected by the diseases associated with the stagnant water.

In 1538, the Portuguese had obtained from Sultan Ghiyasuddin Mahmud, the last Ilyas Shahi king of Gaur, the permission to build settlement in Santgaon on the confluence of the river Saraswati and Bhagirathi-Hooghly. From this time onwards, the Portuguese slowly but steadily became the masters of the water of these riparian tracts. They had a secondary naval station at Tardaha on the confluence of Bidyadhari in South 24-Parganas. In this period Bengal’s political geography was dominated by the so-called Baaro Bhuniyas (twelve landed Chiefs). The Portuguese free-booters became the allies of these independent Bhuniyas against the Mughals and in return got freedom of action in this lower part of Bengal. They went on with their business of piracy with impunity. For nearly a century or so this part of region remained under the effective control of the Portuguese pirates and free-booters. As a consequence, the hitherto populated centres of this region of Bengal got depopulated and jungles of the Sundarbans extended.
The present district of South 24-Parganas was within the kingdom of Pratapaditya (1590-1612), one of the most powerful Bhuniyas of Bengal. In 1612 he was defeated by the Mughal army. The Mughals established a fauzdari at Jessore and the present district of South 24-Parganas came under this jurisdiction. Now, the Mughal Subadar of Bengal turned their attention towards the problems created by the Portuguese. They sacked Hooghly in 1632. It is not clear when the Portuguese were forced to give up Tardah. But, with the waning of the power of the Bhuniyas the Portuguese had lost an important source of patronage.

By this time the Portuguese menace was controlled, but not finally ended, especially in the areas of the southernmost part of Bengal, which were full of rivers, creeks and tiger-infested jungles. The arms of the Mughal Emperor or of the Nawab of Bengal did not effectively reach these areas. Besides the Portuguese, there were Magh or Arakanese pirates operating in the same areas. They would come all of a sudden and swoop down on a river side mart on a market day and looted the merchandise brought for sale. This lawlessness, uncertainties and insecurities became the part of everyday life of the people living in this area throughout the eighteenth and for the better part of the nineteenth centuries.

Then the English appeared. The 24-Parganas were one of the earliest places of their colonial subjugation. The treaty of 1757 between Mir Jafar and the East India Company ceded to the Company the Zamindari rights of 24 Parganas. The British colonial rule continued uninterrupted till India’s independence in 1947.

As the present district of the South 24 Parganas is adjacent to Calcutta, the capital of early colonial rule in India, it had received some enlightening touches of the British rule, like the spread and extension of modern education, and social and religious reform movements etc. However, it has to be remembered, the present South 24-Parganas has a rich cultural heritage. There were many renowned centres of Sanskrit learning in the medieval and late medieval periods. Majilpur was called the ‘second Navadwip’ for its profound studies and culture of the Hindu sastras. Harinavi, Rajpur, all were famous centres of learning. So, when in the nineteenth century the modern western education was beginning to penetrate in this region, a complex interaction was going on between the old and the new.

According to the Annual report on the Public Instruction for 1871-72 by Mr. Woodrow, Inspector of Schools, quoted in W. W. Hunter’s Statistical Account of Bengal: ‘Nine-tenths of the education given in this
district are found on the banks of the old Ganges. The country thus favoured with schools extends from Halisahar to Rajpur, Baruipur, Borol, Govindapur, Bahru, and Joynagar, all populous villages with flourishing English schools under Hindu management.’ There were many important journals published within the district in the nineteenth century. Dwarakanath Vidyabhusan’s *Somprokas* held the foremost place among them. This weekly journal, published regularly on the morning of every Monday, first appeared from Calcutta in 1858 and from April 1862 from Harinavi. Mohanlal Vidyabagish and Sibnath Sastri also edited the journal for some times respectively between 1865 and 1874. The journal discussed literature, philosophy, science, politics and social matters. It agitated on the cause of the peasants and expressed itself boldly against the zamindars, and indigo-planters.

Many of the stalwarts and leading men of nineteenth-century Bengal were either born or had worked in this district at one time or the other. Rajnarayan Basu was born in Basu family of Borol. He was one of the leading figures of the *Brahmo* movement and was the forerunner of the *swadesi* movement of later days. Rajnarayan formed a secret society on the Italian Carbonary model also, although nothing much came out of it till his grandsons Arabinda and Barin Ghose and nephew Satyen Bose appeared on the scene.

Sibnath Sastri had his ancestral home at Majilpur, but was born in the maternal home at Changripota (now Subhasgram). At an early age he joined the social reform movements. He formally joined in Keshab Sen’s *Brahmo Samaj* in 1869. From 1873 he shifted his centre of activities to Calcutta. In 1878 Sibnath Sastri parted ways from Keshabchandra and established *Sadharan Brahmo Samaj*. One of his compatriots, Umesh Chandra Dutta had established *Harinavi Brahmo Samaj*, and the big figures of the Brahmo movement, like Maharshi Debendranath Tagore, Keshabchandra Sen, Rajnarayan Basu, Dr. Protap Majumder, had frequent contacts with this Samaj.

South 24-Parganas was one of the active centres of *Hindu Mela* also. The first ever Hindu Mela in rural Bengal, was held in Baruipur in 1870. The concept of *Swadeshi* was an outcome of the activities of Hindu Mela, though the ideas of *Swadeshi* attained a commanding height at the time of the Anti-Partition movement in Bengal in the first decade of the twentieth century. During this time secret revolutionary movements gained momentum as well.

The present district of South 24-Parganas was a fertile soil of the revolutionary nationalist movement. The
Jugantar Party had a strong base in the district. In 1907, two swadeshi dacoities were held at railway stations on Sealdah Divisional Southern Section line. The first was at Netra station and the second was in Changripota, now called Subhasgram station. Some of the members of the Jugantar Party were involved in these incidents. Narendranath Bhattacharjee, later earned world-wide fame under the pseudonym - Manabendranath Roy - as a member of the Jugantar Party, were involved in these dacoities. Among the others members, there were Kuntal Chakravarti of Joynagar, Saileshwar Basu, Bholanath Chattopadhyay, Makhan Chakravarti and Alok Chakravarti of Changripota. All of them were sentenced to varying terms of imprisonment. The Jugantar Party continued its hold on the locality. Satkari Bandyopadhyay, Harikumar Chakravarty and Aswini Ganguly were the prominent figures of the revolutionary activities in this region. During the First World War, they were involved in the arms deal with the Germans, under the leadership of Jatindranath Mukherjee (Bagha Jatin). But the plan was not successful. Satkari Bandyopadhyay and Harikumar Chakravarty had good organizing skills. In the middle of the 1920s, they formed a new group called Sadhan Sangha in this district. Openly, they began to establish gymnasia and libraries, and from the users of gymnasia and libraries they secretly recruited the political activists, giving them special training in use of arms and ammunitions. They established gymnasia and libraries at Baruipur, Kalyanpur, Boral, Garia, Dhakuria, Diamond Harbour, Sarisha, Joynagar, Majilpur, Barisha, Behala and Bashirhat. Another group, the Bengal Volunteers, had its centres at Kodalia, Mahinagar and Malancha. Dinesh Majumder, the martyr, had a close link with these groups and it is noteworthy that his main area of operation was South 24-Parganas.

It needs to be mentioned that Subhas Chandra Bose and Sarat Chandra Bose’s ancestral home was at Kodalia in the present South 24-Parganas district. Both of them were the members of the first 24-Parganas District Committee of the Congress, which was formed in 1921. This district took an active part in the first Non-Co-operation Movement and later in Civil Disobedience Movement, led by the Congress.

In general, the revolutionary activists and the leftists of the Congress dominated the field of politics in South 24-Parganas. Although their social base was extending significantly, it did not reach the peasantry. That turning point came in the 1940s, but not through the people of the Congress organization. It was the workers of the
Communist Party of India (CPI), who established the link with the peasantry of the Sundarban area in the 1940s. The peasant movement that broke out in Kakdwip, Sonarpur, Bhangar and Canning areas of the Sundarbans in 1946 and continued till 1950 was qualitatively different in character. It was guided by an all-India Party. During the famine of 1943, the functionaries of the CPI had rendered the relief work to the peasantry of this area and established a firm hold in the region. After the famine, they started to organize the peasant masses. The jotedari system had taken roots in the area, and the sharecroppers, marginal peasants and the landless labourers were the worst sufferers.

In September 1946, the Bangiya Pradeshik Kishan Sabha (BPKS) decided to launch the Tebhaga Movement, the aim of which was to secure for the sharecropping peasants a better position within the existing land relation structure.

Kakdwip and Namkhana were the storm-centres of the movement. The movement saw the forging of a remarkable unity between the Hindu and Muslim sharecroppers and small peasants, quite contrary to the general mood of that time. The prominent leaders of BPKS, who were taking the active part to organize the peasantry, were Kangsari Haldar, Asoke Bose and Ras Behari Ghosh; and among participating peasants leaders like Gajen Mali, Manik Hazra, Jatin Maity, Bijoy Mondal and others rose to prominence.

By January 1950, the Tebhaga and its following peasant movements had come to an end. The direct consequence of the movements was the enactment of Bargadari Act of 1950, which later got incorporated as the Chapter III of the West Bengal Land Reform Act 1956. The act recognized the sharecropper’s right to two-thirds of the produce where he supplies usual necessary inputs. The actual realization of the rights granted by the Act was still a far cry. So, another wave from the part of the deprived section of the peasantry was needed. And, this started in the 1960s.

In 1967, the whole of West Bengal saw a peasant uprising on an unprecedented scale. The epicentre of the movement – essentially an organized and militant protest against the non-implementation of land reform legislation – was the Kheyadaha Gram Panchayat of the Sonarpur block. Despite the proliferation of land reform legislations in the post independence period, property relations in rural West Bengal remained virtually unchanged until 1967. Large tracts of agricultural land in excess of ceiling had been either kept by the large landlords in the name of others or had been transformed into illegal fisheries to avoid the land
ceiling act. Led by the local leftist leaders, the peasants and landless agricultural labourers in Sonarpur forcibly occupied the land illegally kept by the landlords and distributed them among the poor peasants. The movement brought into focus the almost semi-feudal land relations of the rural West Bengal and kept the promise of implementation of land reform legislation on leftist agenda. This paved the way for successful land reform in West Bengal after the Left Front came to power in 1977.

Before ending this section, an observation on the cultural heritage of South 24 Parganas may be of particular interest. South 24 Parganas comprises an area which was mostly covered by dense forest in not so distant past. For survival, the settlers had to fight with Nature day in and day out. The same goes on in the Sundarbans even at present time. The hardships of daily existence have given rise to fraternal feelings and non-communal traditions. Members of both Hindu and Muslim communities worship the same Gods and Goddesses, Gazis and Pirs. The two most famous among them are Dakshin Ray and Banabibi. Dakshin Ray is worshiped as the God of tiger and all those who enter the forests for subsistence worship Dakshin Ray irrespective of their caste, creed and religion. Banabibi, on the other hand, is considered as the protector of the inhabitants of the forests. She is popular both amongst Hindus and Muslims. These Gods and Goddesses are not recognised by either religion, but are local deities created and worshipped by local people.

1.3 The Topography

Spreading over an area of 8165 sq. km with a population of 69.09 lakhs in 2001, the district of South 24 Parganas covers almost 9 per cent of the total landmass of the state of West Bengal. Located between latitudes 20°20´ N and 20°06´ N and longitudes 88°20´ E and 88°60´ E, the district is bounded to its due south by the Bay of Bengal, by Bangladesh across the Raimangal and Kalindi rivers to its east, by Kolkata and North 24 Parganas districts to its north-west and north-east respectively and by the districts of Howrah and East Medinipur across the Bhagirathi river to its west.

Two distinct physiographic zones are discernible in the terrain presently known as South 24 Parganas. The northern part of the
South 24 Parganas belongs to what is known as the Marine-riverine Delta. In the sub-recent geological period, the sea receded southwards. As a result, a large area as plain land of very low altitude covered with fine clay of variable thickness and subjected to tidal ingresses got exposed. This required the then existing rivers to extend their courses to meet the receded sea.

The recession of the sea face was due to upliftment of the basement complex. To regain their profiles of equilibrium, the earlier river channels started getting exhumed afresh. However, the deepening of the channels proceeded faster along the course of the Padma river, because of higher volume of water flow, than its western distributaries. Land building activity through these fluvial channels further south also dwindled away. This became pronounced in the early decades of the current century. As a consequence, the physiographic zone under discussion continues to experience the joint impacts of fluvial and marine geomorphological processes, since the rate of land building by the rivers declined. All rivers in this zone experience tidal surges.

Presently this exposed continental shelf is getting covered by sediments carried by tidal inflows as well as by the rivers. These are forms of sediments brought by the tides and the rivers. The tracts between the river channels continued to contain brackish water wetlands until filled up by sediments arriving through the collapse of the natural levees. Such collapses take place periodically as the channel beds rise due to confined sedimentation. Man-made flood jacketing embankments laid close to the tidal channels also collapse periodically with every reduction of the channel cross section. The inflowing sediments through the collapsed structures fill up the depressions containing the brackish water wetlands. This process is now manifesting with many parts of the Wetland of the North Eastern part of the district of South 24 Parganas. Some parts of this wetland are still preserved to raise fish. But these are gradually changing their brackish nature.

Filling up of the inter-fluvial brackish water wetland progressed more extensively in the northern part of this physiographic zone than in the south. The reason is easy to comprehend. Sedimentation from flowing water happens faster with the reduction of water velocity.

In the southern part of the District of South 24 Parganas, the Marine Delta zone is formed of inter-lacing tidal channels. The source of sedimentation is the tidal influx, which is scouring the shallow continental shelf. On the sea face, sand dunes have formed.
Under normal circumstance, the sediments get deposited between the inter-lacing river channels. But this condition has been largely altered by human action. To expand agriculture on this newly forming land mass, embankments have been created along the banks of the channels to prevent incursions of saline tidal water. These embankments enclose a tract to permit cultivation of rice with the help of rain water. As a result, features of the geomorphic processes have been altered.

In the first instance, sedimentation has been confined within the river channels. This is raising the levels of the river beds, requiring periodic strengthening of the enclosing embankments. Once the embankment collapses, tidal incursions extend into the protected agricultural land and expand the area under sediment accumulation. Until such disasters happen, the agricultural fields lose their nutrients. The accumulated rain water enhances leaching process. When the water is drained out during low tide, loss of nutrients also happens.

Rains constitute the major source of potable water. The non-saline aquifers occur at great depth, which is expensive to tap for the generally poor farmers. Shallow tube-wells accelerate the penetration of saline prisms into the so exploited sweet water aquifers. This remains one of the most important reasons behind the backwardness of agriculture of the district. For a vast part of the district, the sources of non-saline water required for irrigation are few and very expensive to tap making agriculture mostly monsoon dependent.

Most parts of this zone have been brought under agriculture by destroying the mangrove vegetation. In the south-eastern part of this zone, some of the mangroves have been preserved, which has been declared as a Bio-sphere Reserve and is used for preserving tigers.

The district of South 24 Parganas can be divided into two distinct agro-ecological zones. The northern part of the district belongs to the \textit{hot moist sub-humid agro-ecological sub region}. The soils have been formed from the alluvium deposited by Ganga and its tributaries and sub tributaries. The soils are intensively cultivated for rice, potato and oilseed crops. Frequent inundation of low lying areas result in stagnation of water for certain times of the year. Besides, flood hazards also affect the normal dry land crop yields. The soils of this sub-region have high nutrient content and mineral resource with a high potential for a large variety of agricultural and horticultural crops.

The coastal parts of the districts of South
24 Parganas comprising mostly Sundarban areas belong to moist sub-humid agro-ecological sub-region. The alluvium deposited by the rivers have gradually developed into deep, fine loamy to fine textured soils, by and large salt impregnated due to tidal flow of sea water through creeks and sub-tributaries. These soils are imperfectly to poorly drained with moderate to very high salinity hazards. The soils remain wet and saline for considerable period of the year and are suitable particularly for salt resistant crops.

### 1.4 The Administrative Profile

From its inception in 1986, the district of South 24 Parganas has its district headquarters in Alipore which itself is in Kolkata. It then comprised of two sub divisions–Alipore(Sadar) and Diamond Harbour consisting of 30 blocks. Presently there are five sub divisions Alipore(Sadar), Baruipur, Canning, Diamond Harbour and Kakdwip, 29 blocks consisting of 312 Gram Panchayats and 7 Municipalities. South 24 Parganas is, indeed, a complex district, stretching from the metropolitan Kolkata to the remote riverine villages in the south upto the mouth of Bay of Bengal. The Alipore(Sadar) sub division lies very close to the Kolkata metropolis, with a well connected network of roads and railway link with Kolkata. The locational advantage of the Alipore(Sadar) subdivision has translated into the development of the region so that the level of development in the Sadar subdivision far outweighs the development of any other region of the district. In the other end of the spectrum are Kakdwip and Canning subdivisions. Some of the blocks in these subdivisions are remote island blocks with very bad transportation facilities and connectivity to mainland. These obstacles definitely proved to be hindrance in development of these areas.

At the helm of the district administration is the District Magistrate who is responsible for the overall governance of the district including law and order. The District Magistrate is assisted by five

1. A decision has been taken to relocate the district headquarter to Baruipur – a more or less centrally located town of the district. The process of land acquisition has started and foundation stone for the district headquarter has been laid at the proposed spot.
Additional District Magistrates and a number of district level officers in discharging the responsibility towards the management of the administration. At the sub divisional level, this responsibility lies with the Sub Divisional Officer. At the lowest rung of administrative ladder, each of the twenty nine blocks has a Block Development Officer who is assisted by block level officers and staffs for smooth running of block level administration.

Figure 1.1: South 24 Parganas (Administrative)
In the spirit of the decentralized governance, as elsewhere in West Bengal, any policy decision regarding the development of an area of the district is taken by the relevant elected representatives. The responsibility for implementing the decisions and overseeing the progress of the project rests with the administration of the relevant level.

The apex institution for local governance of the district is the Zilla Parishad (District Council). For each of the 29 development blocks, the corresponding local governance institution is the respective Panchayat.

Samiti, the jurisdiction of which is similar to that of the block authority. At grassroots level, there are 312 Gram Panchayats, covering areas that fall within the jurisdiction of the Zilla Parishad. Urban governance rests upon the municipal authorities at seven municipalities and Kolkata Municipal Corporation for part of the area adjacent to Kolkata.

The three-tier Panchayat system in the district has a decentralized mechanism for drawing up and implementing development plans. The central elected council of the Zilla Parishad headed by the Sabhadhipati is assisted in its working by some *Sthayee Samitis*, each Samiti being headed by the designated Karmadhayaksha. All plans and programmes initiated by the respective *Sthayee Samitis* and approved by the majority of their members at a formal meeting of the Zilla Parishad are considered as decisions of the Zilla Parishad. The Zilla Parishad sanctions funds for the developmental schemes that are taken up at block level by the Panchayat Samitis within its jurisdiction. All block level schemes sent up by the Panchayat Samitis that require larger funding support as well as any works that may need to be implemented jointly by more than one Panchayat Samiti are also taken up by the Zilla Parishad. The Zilla Parishad also arranges for technical assistance of the schemes executed by the Panchayat Samitis. Additionally, the Zilla Parishad may also directly execute developmental schemes through its own machinery in the block areas.

The District Magistrate functions as the ex-officio Executive Officer of the Zilla Parishad. Like the Zilla Parishad at the district’s helm, each Panchayat Samiti at the
second tier of the panchayat system in the district also has *Sthayee Samitis* led by designated Karmadhyakshas. The Sabhapati and Sahakari Sabhapati who preside over the functioning of each Panchayat Samiti are also ex-officio members of all Sthayee Samitis at block-level. In each development block, the Block Development Officer [BDO] functions as the ex-officio Executive Officer of the concerned Panchayat Samiti. All schemes and decisions approved by the Panchayat Samiti are implemented by these Executive Officers.

At the third level within the panchayat system, each Gram Panchayat is headed by the respective Panchayat Pradhan. The Panchayat Samiti allots periodic funding for various development schemes to the Gram Panchayats under its jurisdiction, and also monitors and evaluates the functioning of these Gram Panchayats through the Executive Officer and other Panchayat Samiti members and officials. Within the 3 tier panchayat system, involvement from the local people in the developmental initiatives is drawn through their participation in public hearings, consultations and meetings. At village level, the local stakeholders also attend Gram Sansad or village council meetings and participate actively in the activities of *Gram Unnayan Samitis*.

In the municipal areas of the district, elected Municipal Boards oversee the overall development of urban areas through several municipal committees. The main functions of each Municipality is to secure potable drinking water, arrange for the lighting of streets and public places, as well as to supervise the development and maintenance of civic drainage systems, provide urban conservancy services, and to develop market and commercial institutions within the urban limits. Each Municipality is led by an elected Chairperson, who is assisted by the elected Municipal Councillors in implementing various urban development works within the Municipality. At the urban grassroot level, each municipal ward has a Ward Committee that formulates urban development schemes for the ward and supervises and monitors their execution.

1.5 The Demography

The district of South 24 Parganas had a population of more than 69 lakhs in 2001. The decadal growth rate of population between 1991 and 2001 had been 20.85
per cent which is higher than the state average of 17.77 per cent. Historically, the population growth in the district had been higher than the state average. In the last century, except in the decades of 1950s and 1970s, the population growth in South 24 Parganas had always exceeded the state average.

Though the district is still largely rural with 84 per cent of the population living in rural areas, the rate of urbanization in South 24 Parganas has been very high, particularly after independence. The decadal growth rate of urban population during 1991-2001 had been 42.85 per cent which is more than double of the state average of 19.88 per cent. The proximity to Kolkata –the largest metropolis in Eastern India—is largely responsible for this phenomenon. This has created a unique problem for the district administration. The aspirations and demand of the people living close to Kolkata and commuting each day for their livelihoods are very different from those people living in rural areas or even in distant muffassil cities. Thus, apart from the staggering size and population of the district, the administration has to contend with problems typical of metropolitan living in the urban area — such as high population density and overloaded civic infrastructure — and in complete contrast, in the rural areas the lack of transport and communication facilities and weak delivery systems.

South 24 Parganas is a district with varying population density. Though a large part of landmass of the district is classified as

forest area and falls under the Sundarban Tiger Reserve, the population density is staggeringly high in Sadar, Diamond Harbour and Baruipur subdivisions with the highest concentration expectedly in Sadar Sub Division and the lowest in Kakdwip Sub Division. Among the blocks, Budge Budge-I has the highest population density at 3764 per square kilometre while Namkhana has the lowest at 433.

The high population pressure in most areas of the district puts enormous burden on the amount of land available for cultivation and existing infrastructure, and thus adversely affects the quality of life in the district.

Almost 33 per cent of population in the district belong to the Scheduled Caste or Scheduled Tribe communities. Among the blocks, Canning-I, Sonarpur and Gosaba have a majority of the population belonging to these communities. Interestingly, the literacy rate among the Scheduled Caste population in the district is almost at par with the overall literacy rate and far exceeds the literacy rate among the Scheduled Caste population in the state.

A significant portion of the population in district belongs to the minority communities. While 65.86 per cent of the population adhere to Hinduism as their religious belief, another 33.24 are Muslims. Unfortunately, the literacy and work participation rates among the Muslims are lower than the district average, though the numbers are indicative of a better performance of the district in terms of development of minority communities than elsewhere in the state.

Human Development Indicators

2.1 Introduction

Human development in South 24 Parganas presents a mixed picture. As can be expected, there are substantial variations in human development across regions. Even within a single region, the levels of human development in different blocks are very different. In this report, an attempt has been made to quantify the levels of human development in the blocks of the district. It should be noted that due to unavailability of compatible data– particularly in constructing the indices for standard of living, human development indicators for the seven municipalities of the district could not be constructed.

2.2 Human Development Index for South 24 Parganas

As reflected in the State Human Development Report (2004), South 24 Parganas is a middle ranked district. Out of the 17 districts in the state, it is ranked

eighth in terms of the Human Development Index. Even for the component indices, it is ranked seventh in terms of Health and Education indices and tenth in terms of the Income index.

The HDI value for South 24 Parganas is 0.60 which is marginally below the state HDI value of 0.61. In an ideal scenario, the HDIs calculated for blocks should be compared to these values to understand the position of the blocks of South 24 Parganas vis-à-vis the district and the state. However, we are handicapped by data unavailability. Hence, the methodology we are compelled to follow in calculating the HDIs for the blocks is different from the one used in the State HDR. Therefore, the numbers we report later in this chapter are not comparable with the numbers in Table 2.1.

### 2.3 Methodology and Data Source

In calculating the Human Development Index (HDI), we have attempted to follow the methodology suggested by UNDP as far as possible. But unavailability of block level data for many important parameters proved a hindrance here. The HDI attempts to capture in summary form the three basic dimensions of standard of living, education and health. Each of these indicators is defined as a dimension with value between 0 and 1 with reference to minimum and maximum value. The general formula for calculating each dimension index is:

\[
\text{Index} = \frac{\text{Actual Value} - \text{Minimum Value}}{\text{Maximum Value} - \text{Minimum Value}}
\]

The HDI is then calculated as a simple average of the three different dimension values.

As a proxy for the standard of living of an average person in a region, UNDP has proposed the average per capita income of the region. A major problem of accepting the same for a measure of standard of living in the DHDR arises from the fact that no block level measure of per capita income is available from any official source. The lowest level for which NSSO collects and publishes data on per capita consumption expenditure is the district; this is clearly unsuitable for use in the DHDR which focuses on block level variations. No official block or municipality level statistic for a variable that may be taken to be a sufficiently close approximation to the per capita income is available.

In calculating the block level index for standard of living we have used the household level data for each block from the Rural Household Survey (RHS) for the district of South 24 Parganas undertaken by the Government of West Bengal in 2005. The RHS data gives information on the households in the district based on the
following parameters: (a) landholding, (b) housing condition, (c) clothing, (d) food security, (e) educational status, (f) consumer durables, (g) earning capability, (h) livelihood, (i) child education, (j) indebtedness, (k) migration, and (l) special types of vulnerability. Each of the above parameters is further sub-divided into five levels of achievement from worst to best. The households are ranked with a minimum score of 1 to a maximum score of 5 according to their achievement level on each of the above-mentioned parameters. So each of these parameters has five levels representing scores 1 to 5. Thus, every household can score a maximum of 5 in the achievement scale for each of the 12 parameters. So the maximum score in the achievement scale of a household can be 60. On the other hand, a household with the worst condition in a particular parameter has a score of 1. So a household being deprived in all 12 parameters has a minimum score of 12 on the achievement scale.

For the construction of the standard of living index, we have considered achievement of each household in five dimensions - (a) food security, (b) housing (c) clothing (d) livelihood and (e) ownership of consumer durables. Food, housing and clothing are the basic needs of life in which achieving higher score implies better standard of living. Use of consumer durables over and above the basic needs can indicate higher purchasing power and better standard of living for the household. Together with this, the main source of income for the household is likely to give an indication to the living condition of the household.

In the Rural Household Survey, each household is assigned a score between 1 and 5 in each of these dimensions. For any arbitrarily chosen block, the number and percentage of households at each score are used to generate a score for the block in a particular dimension. This block level score indicates the score a randomly chosen household in the block is likely to achieve in the said dimension. Then the block level achievement index for that dimension is computed using the general formula for calculating the dimension index with the maximum and minimum values being taken to be 5 and 1 respectively. Finally, standard of living index for a block is a simple average of the achievement indices across five dimensions of food security, housing, clothing, livelihood and ownership of consumer durables.

The education index consists of a weighted average of the projected Census literacy rate (two-thirds weight) and the school enrolment rate for the 5-8 age groups (one-third weight). The maximum and minimum values for both these dimensions are taken to be 1 and 0 respectively. This
is in accordance with the UNDP methodology.

In absence of any block level data on life expectancy at birth, the health index takes into account the following aspects:
- Health Infrastructure,
- Safe Delivery,
- Immunization of children,
- Safe Drinking Water, and
- Sanitation facilities.

The sub-indices have been prepared to reflect the block level situation for each of these aspects. For instance, the infrastructure sub-index is based on the estimates of doctors per lakh persons and beds per 10,000 persons. Indices have been estimated for these two parameters, and then combined using equal weights. The safe delivery sub-index is based on estimates for percentage of safe deliveries – when safe delivery is defined as deliveries occurring in a medical institution or at home attended by a trained medical attendant. Four types of immunization – BCG, Measles, OPV and DPT – have been considered in preparing the immunization sub-index. The immunization sub-index is based on a simple average of percentage of children given their full dose of each of these four vaccines. Safe drinking water sub-index is based on the percentage of households with access to either tap, hand pumps and tube-wells either within their home or nearby (within radius of 200 meters of their residences). Finally, the sanitation sub-index is constructed using estimates of the proportion of households with latrine facilities within their residences out of total households. The sub-indices are then combined using equal weights to calculate health index for the block.

The data on the first three sub-indices was provided by CMOH, South 24 Parganas, while the estimates for safe drinking water and sanitation are based on projections of figures available in Census, 2001.

2.4 The Indices

The analysis of block level human development indicators brings about many interesting observations. There exists very high degree of variations across blocks in terms of achievement in the standard of living and health dimensions. The achievement in education dimension is more uniform across the blocks highlighting the success of the Government programmes for achieving universal literacy and primary school enrolment. While the Standard of Living and the Health Indices have coefficients of variation of 17 and 16 per cent respectively, the coefficient of variation for the Education Index is only 4 per cent.

Source: Own calculation based on Rural Household Survey, GoWB for the standard of living index, data provided by the Office of the CMOH, South 24 Parganas the Office of the District Project Officer, Sarva Sikksha Avijan, South 24 Parganas and Census of India, 2001 for health and education indices.

As one may expect, the Sundarban region is worst performing among the three regions. Four among the five worst performing blocks in terms of overall
human development index are located in the Sundarbans. On the other hand, three among the top five performers are from the North West (NW) region. Eleven out of thirteen Sundarban blocks have HDI values below 0.60, while all six blocks of the North West region have HDI values above 0.60 with four of them having HDI values exceeding 0.65. In comparison, in North East and Mid West (NE & MW) Region, seven out of ten blocks have HDI values above 0.60. This indicates the high degree of regional disparity in human development.

A component wise analysis helps us understand the problem better. In terms of standard of living, the top five blocks are all from the North West region. While the average rank of a block in terms of standard of living is below 5 in the North West region, the same is above 22 for the Sundarban region. This clearly indicates the large disparity in the standard of living between the regions. In terms of education and health index, the inter-regional variation is more moderate. While the average block ranks for elementary education are 9, 17.8 and 15.6 in North West, North East and Mid West regions respectively, the same for healthcare facilities are 9.3, 15.6 and 17.2. It is indeed heartening to see that Sundarban outperforms the North East and Mid West region in educational achievement. In fact the top three performers in education in the district are all Sundarban blocks. Even in terms of healthcare achievement, two among the top five blocks in the district are from the Sundarban region.

Apart from the high degree of inter-regional variation, wide disparity in performance among the blocks within the Sundarban region is also very prominent in the district. This is not so much for the standard of living, but typical for performance in education and health. The standard of living which is largely dependent on remunerative livelihood opportunities is more homogeneous within a region. But performances in education and healthcare to a large extent depend on people’s consciousness, administrative expediency and political will which are again highly correlated. Hence, one observes significant variations in terms of these indicators among blocks.

In the district of South 24 Parganas, the top three performers in education are Namkhana, Sagar and Pathar Pratima in

---

Figure 2.1: Average Rank of a Block: Region-wise

---
that order, while the worst performers are Canning-II, Basanti and Canning-I. All six are Sundarban blocks. Similarly, Canning-I is the top performer in the district in terms of provision of healthcare, but Gosaba remains at the bottom rung of the ladder. The intra-regional variation is relatively muted for all three indicators in case of the other two regions. Overall, it seems that, except Canning-I, the blocks in Canning sub-division in the Sundarban region are most underdeveloped in every aspect of human development.

It is evident that in South 24 Parganas, the variation in the level of human development is explained to a large extent by variations among the blocks in terms of standard of living. This becomes clear once one looks at the range of index values for different components as well as the overall human development. The worst performing block in terms of overall human development, Basanti, has an index value of 0.50, while the same for the best performer Thakurpukur-Maheshtala is 0.72. Thus, the attainment of Basanti in terms of human development stands at 69 per cent of that of Thakurpukur-Maheshtala. In case of the three components of human development, the achievement of the least developed block stands at 50 per cent, 82 per cent and 56 per cent of the achievement of the best performer for standard of living, education and provision of healthcare respectively.

Before we end this discussion, one note of caution needs to be added. The numbers representing the index values – particularly for education and health – are of suggestive nature. For example, to calculate the education index we used enrolment data for state-run educational institutions only. Sonarpur – a block located very close to Kolkata and of primarily urban nature – has obtained a rank equal to 20 in our calculation. This has happened because of low primary school enrolment rate in Sonarpur. We suspect that one factor that may be responsible for this phenomenon is the substantial enrolment in private primary schools in urban blocks like Sonarpur. The education index values for such blocks may improve to a significant extent if the children going to private schools can be accounted for in calculation of enrolment rates. Unfortunately, we do not have access to that information. A similar story is true for healthcare provision as well. With present proliferation of private nursing homes and healthcare infrastructure in areas close to urban centres, the pressure on state run health care system is much lower. This may have affected our calculation of the healthcare indices in these areas.
Material Conditions and Standard of Living

3.1 Introduction

The West Bengal Human Development Report 2004 recognized West Bengal as a middle income state – ranked ninth among the fifteen major states in terms of both per capita income as well as per capita consumption expenditure at the turn of this millennium. The district of South 24 Parganas portrays a less impressive scenario among the districts of West Bengal. It ranks eleventh among the eighteen districts of the state in terms of per capita income in 2000-01. In 2000-01, an average person living in the district earns 88 per cent of the per capita income of the state, 68 per cent.

1 The data for per capita income is available only for the combined Medinipur district in 2000-01.
cent of the per capita income of the highest ranked district (Darjeeling) in the state other than Kolkata and 44 per cent of the per capita income of Kolkata. The situation is not encouraging at all to say the least. Over the last few years the relative position of the district vis-à-vis the other districts remains almost the same (Table 3.1).

Table 3.1 reflects a picture that does not speak well for the district. From 1993-94 to 2003-04, the relative position of the district in the state has worsened, even though marginally. Even predominantly rural districts - located far from Kolkata-like Malda and Dakshin Dinajpur have performed much better than South 24 Parganas in terms of achieving higher per capita income. The Bureau of Applied Economics and Statistics (BAE&S), Government of West Bengal, reported that the average annual growth rate of per capita income at constant price in South 24 Parganas between 1996-97 and 2003-04 was 5.68 per cent, which, while not bad, is by no account remarkable.

### 3.2 Sectoral Composition of Output

The share of primary sector in net domestic product declined both in the state of West Bengal as well as in the district of South 24 Parganas between 1993-94 and 2003-04. One observation that is particularly heartening for the district is the healthy rate of growth of output in the secondary sector. According to the report published by BAE&S on the state and district domestic products of West Bengal, the secondary sector output at constant prices has doubled between 1993-94 and 2003-04, with the growth evenly spread among the manufacturing, construction and electricity, gas and water supply. The annual average compound growth rate in the secondary sector was 7.18 per cent over this period; this outstrips the state average for the same by more than one percentage point. If the construction of the proposed Kulpi port takes off, it will give great impetus to the manufacturing sector in the
district for generating productive employment and improving the standard of living in the district. Having an already established industrial base in the Budge Budge – Maheshtala industrial belt and Falta Export Processing Zone and being located close to Kolkata geographically can only help its cause in becoming a first-choice location for manufacturing investment. The share of registered and unregistered manufacturing in the net domestic product of the district was 19 per cent in 2003-04 compared to 11 per cent for the state as a whole.

Agriculture and pisciculture continue to be two very important sources of livelihood in the district of South 24 Parganas. According to 2001 census, 49 per cent of rural workers were then engaged in agriculture, while in 2003-04 agriculture has contributed only 16 per cent of net domestic product of the district. This shows the enormous labour-absorbing power of agriculture. Agricultural output has grown by 3.40 per cent per year on average during the decade 1993-94 to 2003-04. This is marginally lower than what the state as a whole experienced over the same period. The population pressure on land has been historically very high in West Bengal and the district of South 24 Parganas is no exception. The amount of cultivable land per agricultural worker is only 0.41 hectare in the district. Moreover, while one of the reasons behind the progress of agriculture in the districts like Hooghly and Burdwan is the enhancement of ground-water irrigation thus inducing more intensive cropping pattern and cropping diversity, the irrigation facilities in South 24 Parganas have not been extended to a satisfactory scale. In fact, in 2001-02 only 29 per cent of the cultivable area was irrigated. As a result, agriculture in the district mostly

### Figure 3.2: Sectoral Composition of Net Domestic Product of South 24 Parganas and West Bengal in 2003-04
remains a mono-crop activity. The agricultural employment in a large part of the district is thus of seasonal nature.

In 2003-04, almost 10 per cent of net domestic product of South 24 Parganas is generated in pisciculture. Being a riverine district with almost a third of the population living in islands of the southern Sundarban blocks, fishing is a natural occupational choice for a large portion of the population. Historically, the district has both saline and sweet water fisheries. As reflected in the district statistical handbook published in 2005, only about 40 per cent of total area available for pisciculture is being put to effective use in the district presently. This is a serious under-utilization, particularly considering the natural propensity and specialization of the people of the district in this particular profession. In 2005, almost 3.75 lakh persons were engaged in the professions related to pisciculture and this number is about 17-18 per cent of total rural workers.

The service sector has grown rapidly in South 24 Parganas over the decade spanning 1993-94 to 2003-04. The share of services in NDP was 47 per cent at 2003-04 as against 40 per cent in 1993-94. The major contributory services are trading, banking and insurance and real-estate.

### 3.3 Structure of Landholding

South 24 Parganas is a land scarce economy just like the rest of West Bengal. Though the population density for the district is lower than the average for the state, 44 per cent of the reported area of the district is forest area, making the effective density of population much higher. With 85 per cent of the total population living in rural areas with limited livelihood opportunities other than agriculture, the pressure on land is immense.

Availability of cultivable land is a critical determinant in the choice of livelihood in rural areas of the district. While per capita cultivable land for rural population is the lowest at 0.019 hectare in Thakurpukur-Maheshtala block, the same is 0.126 hectare in Patharpratima block and 0.106 hectare in Kultali block. Consequently, while only 19.48 per cent of total workers depend on agriculture for their livelihood in Thakurpukur-Maheshtala, this percentage is more than 60 in many Sundarban blocks including Patharpratima and Kultali. Generally, the settlement density is lower in the Sundarban region, thereby making the land availability scenario better than the rest of the district. On the flip side,
many of the Sundarban blocks are close to the Bay of Bengal and being enclosed by rivers with saline water have very limited irrigation facilities. Thus, Sundarbans remain mostly a mono-cropped area making earning a proper livelihood from land more difficult.

The scope for generating additional employment in land is also very limited unless the cropping intensity of the district

changes significantly. Already, 2-4 agricultural workers are employed per hectare of cultivable land in most of the blocks though many of them are monocropped areas. In South 24 Parganas, the major crop is Kharif paddy with only some pockets of cultivation for other produces. Over the last few years, the price of food-grain, particularly rice, has increased at a relatively much lower rate to prices of purchased inputs. Post liberalization withdrawal of input subsidies has reduced the return from cultivation significantly, thus making agriculture a less preferred choice of livelihood. The district is thus poised for a great degree of occupational diversification which is already in evidence in some blocks where alternative livelihood opportunities present themselves. The pattern and trend of occupational diversification towards non-farm sector is discussed in detail in a separate chapter of this report.

**3.4 Land Reforms**

It has been well recognized and documented by eminent social scientists that one of the major successes of the Left Front Government was the implementation of land reforms in the state after 1977. This not only changed the agrarian relations and the organization of agricultural production in the rural economy, but also went a long way in creating a democratic environment in the rural society where the peasantry became more conscious of their duties and rights. As rightly pointed out in the West Bengal Human Development Report 2004, land reforms represented the outcome of a long period of struggle by the peasantry and the social and political mobilization of the landless and the share-croppers in the countryside. At least two major peasant movements that the state of West Bengal witnessed in the post-independence period had originated from the district of South 24 Parganas. The historical movement of the share-croppers in 1948 for three-fourth share of the produce – popularly known as ‘Tebhaga Andolan’- had started in the Kakdwip block. In 1967, the peasants of Sonarpur block started re-acquiring land which were rightfully theirs but were forcibly acquired and registered under false names by the landlords. It is not surprising, therefore, that the district of South 24 Parganas has done well in this front.

The process of land reforms took shape in the form of (i) acquisition of excess land over that permitted by land ceiling and redistribution of vested land and
(ii) securing of tenancy rights through a programme of universal registration of tenants called ‘Operation Barga’. According to the latest available information from the Office of the District Land and Land Reforms Officer, 126818 bargadars are registered in South 24 Parganas. As on 2001, the extent of such registration as proportion of total cultivators in the district is 31.7 per cent which is slightly higher than the state average. So far 1.02 lakh acres of land have been identified as vested land in the district out of which 70 per cent have been distributed among 164670 pattadars giving each beneficiary 0.43 acre of land on an average.

Though overall 70 per cent of the total amount of vested land has been distributed in the district, a look at the more disaggregated data reveals that there is yet scope for improvement here. Even after accounting for the fact that some amount of vested land may be kept aside for other uses, large area of land is still available for distribution in blocks like Sonarpur, Kulpi, Canning-II, Basanti, Patharpratima, Kakdwip and Sagar. This should be immediately taken care of, particularly so in the blocks of the Sundarban region where agriculture still

Source: Office of the DL&LRO, South 24 Parganas
remains the only source of livelihood for a majority of the people.

The success of the district of South 24 Parganas in implementing the land reforms, however, lies elsewhere. The district has been extremely successful in ensuring that the benefits of land reforms reach the most underprivileged sections of the society. Though only 32.12 and 1.23 per cent of the total population belong to the Scheduled Castes and the Scheduled Tribes respectively, the persons belonging to these groups comprise 39.22 and 7.94 per cent of the total number of pattadars. While in West Bengal the single female and joint patta holders consist of only 15.6 per cent of total number of patta holders, the corresponding number for the district is 51.1 per cent. This is indeed a very laudable effort and has very positive implication for the cause of gender empowerment.

3.5 Distribution of Landholdings

The distribution of landholdings is extremely fragmented in South 24 Parganas. In all the blocks, even in the distant and almost completely rural blocks, more than 85 per cent of households are either landless or marginal farmers. This is not at all surprising, given the immense population pressure on land in absence of alternative livelihood opportunities. The successful implementation of land reforms in the district also played its part in fragmenting the land ownership structure. There are relatively few medium and large farms in the district.

According to 2000-01 Agricultural Census, only about 2 per cent of the farms in South 24 Parganas operate land larger than 2 acres. The total area under operation of these farms is about 9 per cent of the

</table>

On the other hand, almost 86 per cent of the holdings are marginal holdings less than one acre of land in size. This is a clear indication of how fragmented the distribution of land is in the district.

A disturbing feature becomes evident once one looks at number and area-wise...
distribution of holdings under different size classes over time. Even in the early nineties, there has been increasing marginalization of landholdings. From the early to mid nineties, the number of marginal holdings increased whereas the total area of operation under marginal holdings remained more or less stagnant. During the same period, there has been a fall in the area operated by other types of holdings. One can attribute this event to increasing population pressure on land when there are few other livelihood opportunities. But from the mid nineties onwards, both the number of holdings and area under operation fell across all size classes, indicating an increasing alienation from land. One possible reason for this is the steep rise in the cost of purchased inputs after post-liberalization withdrawal of agricultural subsidies without any compensating increase in either farm productivity or in the price of output. As a result, the marginal farmers are either forced to put their small pieces of land into alternative uses wherever the opportunities present themselves, or in some cases may even be involved in distress sale of land.

Looking at a more disaggregated level, in no block of South 24 Parganas more than 5 per cent of households have more than two acres of irrigated land or more than 4 acres of non-irrigated land. Even among the Sundarban blocks where hardly any alternative exists only Gosaba and Patharpratima have more than 15 per cent of the households with larger than one acre farms. Given the present state of agriculture in the country as a whole and the state in particular, it is extremely difficult for tillers of such small plots of land to maintain a living in a district with relatively backward agriculture. Consequently, diversification into non-agriculture has become a prominent phenomenon whenever an opportunity presents itself. But in areas where such opportunities are missing, there is rising impoverization of people dependent on agriculture.

### 3.6 Agricultural Production and Yield

South 24 Parganas, unfortunately, is a district where the potential in agriculture is severely underutilized. The district represents mostly mono-crop cultivation with kharif paddy being the dominant one. With only about 30 per cent of net cultivable area having irrigation facility, increasing cropping intensity and crop diversification remain difficult for the farmers. As a result, the employment opportunities in agriculture become limited, besides, decreasing the return from land for
the cultivators. The following table shows the meagre amount of land put into use for cultivating crops other than rice and their levels of production in the district.

It is clear that except for *aman* rice and to a little extent oil seeds, area and production of all other principal crops in the district have declined over the five year period between 2000-01 and 2004-05. Oil seeds cultivation in the district is mainly limited to Bhangar-I and Bhangar-II blocks where almost 100 per cent of the agricultural land are irrigated. Blocks like Sonarpur and Bishnupur-I have satisfactory irrigation facilities, but being close to Kolkata, are consequently subjected to rapid urbanization and corresponding shrinking of agricultural activity. The *boro* rice cultivation which is more dependent on irrigation because of its intensive use of water has suffered a dip both in terms of area under cultivation and level of production.

It is interesting to note that yield rate of rice in South 24 Parganas has always been lower than that in the State. There has been a tendency towards catching up in the 1990s, but unfortunately since 2000-01 the productivity growth of rice has been stagnated in the state. South 24 Parganas

3.7 Infrastructural Facilities

The extent of economic development and the opportunity for employment for the common people in an area significantly depend on the development of basic infrastructural facilities. The development of physical infrastructure like roads, electricity, banking etc. plays a very crucial role not only in enhancing the productivity and marketability of agricultural products, but also is immensely important for development of small business enterprises on which a very large section of rural population depends for their livelihoods. In the industrial map of South 24 Parganas, organized manufacturing sector has a very small presence except for in some pockets in Sadar sub-division and the export processing zone in Falta. A vast majority of the rural workers outside the agricultural sector are employed in micro business enterprises. The difference in the physical infrastructural facilities across the blocks is an important determinant of the

Source: BAE&S, GoWB
Note: The total irrigated area in Bhangar-I is higher than the net cultivable area in the Table. Notice that while the data on irrigated area is for the year 2003-04, the data on net cultivable area is for 2001-02. This has caused the discrepancy.
variation in the livelihood patterns of the people, and thus in the standard of living.

Since agriculture continues to remain a major livelihood for a large number of people in rural South 24 Parganas, the lack of irrigation remains a major infrastructural bottleneck, specially for the rural areas of the district. Only about 30 per cent of the cultivable area in the district is irrigated with the two major sources of irrigation being canal irrigation and irrigation from stored rain-water in the tanks. The rapid expansion of minor irrigation with shallow and deep tube-wells that brought about almost revolutionary change in agriculture elsewhere in West Bengal, specifically in the districts like Burdwan and Hooghly, did not take place in this district. In fact, only about 10 per cent of the total irrigated area of the district is covered by shallow and deep tube-wells. Lack of access to electricity in many areas is possibly an important reason behind failure of minor irrigation facilities in the
district.

A block level analysis of the irrigation facilities available highlight the precarious scenario even more (Table 3.7). Out of the total twenty-nine blocks, twelve blocks have

Out of the worse performing twelve blocks, ten are located in the Sundarban area while none of the Sundarban blocks have more than 50 per cent of their net area under irrigated-cultivation. Lack of access to irrigation is a major problem in most of the blocks of South 24 Parganas, but the Sundarban region calls for a special mention here. Agriculture is the most important source of livelihood for the people in the predominantly rural Sundarban region where there is hardly any employment opportunities outside the primary sector. Underdeveloped irrigation facilities there - not just in absolute terms but also relative to the other regions of the district - besides, denying the people of the Sundarbans access to the most important source of livelihood, also increase the regional disparity within the district.

Availability of electricity, access to good quality roads and formal banking and financial institutions are other important indicators of physical infrastructure in the area. For any entrepreneurial activity - small or large – either in primary, secondary and tertiary sectors, these three are important ingredients. Thus, the development of these
infrastructural facilities has important implications for the livelihood of the people and their standards of living. These obviously have very important contributions towards provision of a range of basic services and utilities including health and education.

A blockwise analysis of physical infrastructure reveals many interesting observations (Table 3.8). According to 2001 Census, 258 persons per thousand population had access to electricity in the district. At the same time, only one person in Kultali, four persons in Basanti, seven persons in Patharpratima, nine persons in Gosaba out of one thousand enjoy the benefit of electricity. The district has about one kilometre of surfaced road per square kilometre area. The same figure is 0.13 kilometre in Gosaba, and 10.34 kilometres in Budge Budge-I. These are examples of striking regional imbalances.

Based on the available data on physical infrastructure and irrigation facilities presented in the last two tables, it is possible to construct an infrastructure development index for the blocks of the district. The rank correlation of the standard of living index and the infrastructure development index is very high at 0.90. It appears to be the case that a significant amount of variation in the standard of living in the district can be explained by variation in development of infrastructure. This leads to very important policy conclusions.

The top five blocks in terms of infrastructural achievement are all close to Kolkata except Bhangar-I. Bhangar-I moves up the ranking ladder in terms of available infrastructure because of its very good record in irrigating the agricultural land. If we reconstruct the infrastructure development index by excluding the index for irrigation, the rank of Bhangar-I drops significantly to 16. On the other hand, the bottom five blocks are all from the Sundarban region in terms of infrastructure development either including or excluding the irrigation index. In fact, the differences in available infrastructure even in absolute terms are huge. While only three blocks have an infrastructural development index above 0.45 – the highest being 0.73 for Budge Budge-I, nine out of 13 blocks in the Sundarban region have this index below 0.10. The worst performers here are Kultali, Basanti and Canning-II. Overall, there is definitely a strong case for immediate prioritization of the development of infrastructure in the Sundarban region.

The infrastructure development index is computed using the same procedure used to compute the HDI. Using the data presented in Tables 3.8 and 3.9, first the four component
indices for irrigation, electricity, roads and banking services are computed from the general formula:

$$\text{Index} = \frac{\text{Actual Value} - \text{Minimum Value}}{\text{Maximum Value} - \text{Minimum Value}}$$

For irrigation and electricity, the maximum and minimum values are chosen to be 1 and 0 respectively to represent the best and the worst possibilities and the relative achievement of the block in the target scale. For roads and banking services, the maximum and the minimum values are the corresponding values of the best and the worst achievers in each dimension. Once the index for each component is computed, a simple average of four component indices is taken to constitute the infrastructure development index for each block.

### 3.8 Poverty Scenario in South 24 Parganas

The performance of South 24 Parganas in poverty reduction is very ordinary. As estimated from the Rural Household Survey 2005, more than 4 lakhs of households have been identified as Below Poverty Line households, pushing the poverty ratio in the district up to 34.11 per cent. This is way above the state as well as the national poverty ratio. Despite directed attempts at poverty reduction for a long time, the achievement is far from satisfactory.

An examination of block-wise poverty ratios (Table 3.10) reveals that in Basanti 65 per cent of households are poor in 2005, making Basanti one of the poorest block in the whole country. Kulpi and Canning-II do not fare much better with poverty ratios of 53 per cent and 50 per cent respectively. The poverty rates are very high in the Sundarban region with all thirteen blocks registering poverty ratios.

Source: Rural Household Survey, 2005

households living below the poverty line. The rest have poverty ratios below 20 per cent (Figure 3.6).

In Table 3.10, the last two columns show excellent agreement. This suggests that the poverty ratio and the standard of living index across blocks are very closely related. In fact, the rank correlation coefficient between these two is equal to 0.96. However, one thing needs to be mentioned here. In Table 3.10, the last two columns show excellent agreement. This suggests that the poverty ratio and the standard of living index across blocks are very closely related. In fact, the rank correlation coefficient between these two is equal to 0.96. However, one thing needs to be mentioned here.

In the North East and Mid Central region, all the blocks except Kulpi have poverty ratios below 30 per cent. In the North West region, Budge Budge-II has a relatively high poverty ratio at 34 per cent and Sonarpur is a mediocre performer with 23 per cent standard of living index, in Thakurpukur-Maheshtala and Basanti respectively. The standard of living for an average person - captured by the standard of living index, in Thakurpukur-Maheshtala and Basanti respectively. The standard of living for an average person - captured by the standard of living index, in Thakurpukur-Maheshtala and Basanti respectively. The standard of living index, in Thakurpukur-Maheshtala and Basanti respectively. The standard of living index, in Thakurpukur-Maheshtala and Basanti respectively.
Maheshtala is almost doubly better than that of an average person living in Basanti. At the same time, the poverty ratio in Basanti is ten times more than that in Thakurpukur-Maheshtala. This implies that improvement in material conditions has disproportionately benefitted the relatively well off, particularly for the less developed blocks. The last observation calls for targeted intervention in the form of specific programmes or schemes for helping the poor come out of the shackles of poverty.

3.9 Basic Requirements of Human Life: Food, Clothing and Housing

The most common indicator used as a proxy for standard of living is per capita income. In absence of reliable block level data for per capita income, we looked at several household specific parameters that closely depend on the income of the households. We have mostly focussed on the basic necessities of life – that is food, clothing and housing. It is interesting to note how the households fare in accessing these basic necessities in different areas and how much intra-district variations exist in them. We believe that the households’ preferences are hierarchical. This means that the households spend their incomes on these items in the said order. Once the households meet their basic requirements in these items, they start spending their extra incomes on other durable items. Hence, we also looked at the ownership pattern of the consumer durables for getting a better idea of the standard of living of the households across blocks. It may not be out of context to mention here that we have included these four parameters along with the livelihood patterns of the households in computation of standard of living index for each block.

Though there are some doubts regarding the dependability of the Rural Household Survey 2005, the estimates on various...
parameters obtained from it are truly alarming. The RHS data suggest that 2.18 lakh rural households in the district cannot manage to have even one proper meal everyday year round. The number is close to 18 per cent of total number of rural households in the district. The finding is very sobering for all concerned not just for the level of underdevelopment in the district, but also on humanitarian grounds. The farthest point of South 24 Parganas is less than 100 kilometres away from Kolkata, one of the largest, and fastest developing metro cities in India. Yet, a large section of the population in the adjacent district cannot fulfil the most basic human requirements – food. Even in Sonarpur block which is literally a stone’s throw away from Kolkata, about 14 per cent of the households live in perennial hunger (Table 3.11).

A block wise analysis of the situation of affordability of food to rural households reveals that Sundarban is once again the worst hit region. In all the thirteen blocks of Sundarban, more than 10 per cent of rural households suffer from absolute food insecurity meaning that they cannot even manage one square meal everyday year round. There are six Sundarban blocks where more than 20 per cent people suffer from such acute crisis with Basanti being the worst affected block in the district with 37 per cent of the households suffering. Out of the six blocks in the North West region, Budge Budge-II is surprisingly a bad performer in this count with about 25 per cent of households suffering from food insecurity. Given its performance in terms of the other parameters we discussed so far, Bhangar-II has done quite well in terms of this parameter probably for its relatively well-developed agriculture.

As estimated from the Rural Household Survey, 36 per cent of the rural households do not own any winter garments. South 24 Parganas being a district with very mild and short winter and with most of the relatively underdeveloped blocks located close to sea,
ownership of garments and proper clothing to remain prepared for the winter weather is not a major problem for the district. In fact, more than 57 per cent of the households in Basanti and 49 per cent in Patharpratima do not own any winter garments at all. But this probably is more a matter of choice for the households rather than access. The priorities of the people in the district are likely to be very different from a region where the weather is so harsh that proper clothing is an absolute necessity for survival and as a result the expenditure patterns also vary. Clothing probably is at a lower step in the priority-ladder of the people in South 24 Parganas.

It is unfortunate but true that even after sixty years of independence and thirty years of Panchayati system of administration, every four in hundred households do not have a shelter to sleep at night in the district of South 24 Parganas. A further 50 per cent of the households live in a hut with only one room. A large part of South 24 Parganas, particularly the

Source: Rural Household Survey, 2005
Sundarbans, is very prone to natural disasters like tidal waves, storms and cyclones. Sadly, except in Joynagar-I, nowhere in the Sundarban areas more than 30 per cent households live in pucca or partially pucca houses. In blocks like Basanti, Gosaba, Canning-II and Patharpratima, even 10 per cent households do not enjoy the security of living in pucca or partially pucca houses. This is one area that requires urgent attention because it is associated with security of human life and property. The situation though had been worse and has improved lately because of the importance the government has attached to housing for the poor. New houses though with very basic facilities have been built with direct assistance from the government and under the supervision of the local Panchayat under different government schemes, particularly the Indira Awas Yojana. But a lot is yet to be done (Figure 3.9).

3.10 Concluding Remarks

The analysis of the material conditions of the district reveals that lack of infrastructure in the rural areas remains the major obstacle in the process of development in the district. The average standard of living in the blocks is significantly
correlated with the level of infrastructural development. In absence of irrigation facilities, agriculture in the district remains primarily mono-cropped. With the post-liberalization increase in the cost of purchased inputs, agriculture has become unremunerative in many areas. As a result, a significant decline in the number and area of different size classes of holdings have been observed in late 1990s. A major revamp of irrigation facilities is required to increase cropping intensity in agriculture.

However, given its proximity to Kolkata and the existing industrial base in the eastern bank of Hooghly river, the district has a real potential for industrial development. But, to achieve this end prompt action must be taken by identifying potential areas for industries and developing these areas with appropriate infrastructure. Manufacturing growth in the district has exceeded the same for the state in the recent past. This needs to be maintained by encouraging small scale industries.

A high level of regional disparity is observed almost in all material aspects of life. The Sundarban remains the most backward region in terms of quality of life. This needs to be addressed urgently. Poverty remains a major problem in some blocks with poverty ratio exceeding 50 per cent. Targeted government intervention for eradication of poverty is earnestly required in these areas.
Employment Trends and Livelihood Pattern

4.1 Introduction

Human Development is a multifaceted concept embodying not just quantitative improvement measured through increase in per capita income but also improvement in qualitative aspects of life such as increasing life expectancy and educational attainment. Nevertheless, per capita income alone is not a bad indicator of human development because it has been found in many developing countries that there exists high correlation between per capita income and other variables that describe “human development”. Since per capita income is the manifestation of employment opportunities available, so while assessing human development it is important to examine the occupational trends and livelihood patterns of the population. The dynamics of employment trends and livelihood pattern is thus very closely related to the development of a society.

South 24 Parganas is, indeed, a complex district, stretching from the metropolitan Kolkata to the remote riverine villages in the south up to the mouth of Bay of Bengal. While the Alipore sub-division lies very close to the Kolkata metropolis, Kakdwip, Canning and Diamond Harbour sub-divisions are in the southern part of the district. Baruipur subdivision is centrally located, being well connected with the urban centre of the district and also lying close to the blocks of Sundarbans. Sundarbans, the largest mangrove forests on earth, are spread over thirteen of the twenty-nine development blocks in the district. In 2001, about 86 per cent of the population in the district resided in the 29 blocks (out of which 84 per cent resided in the rural areas and 2 per cent in the urban areas) of the district, while 14 per cent resided in the municipal areas. Overall, it may be said that there exists wide topographic variation within the district. This variation often translates into differences in economic conditions across various regions of the district owing to the differences in the available employment opportunities based on the distribution of natural as well as man-made resources. Accordingly, inter-region as well as intra-region variation of employment trends and livelihood patterns within the district up to the block/municipality level need to be addressed.

Before an in-depth analysis of the employment situation of the district is made,
we take a quick glance at the overall performance. In 2001, one-third of the district population were employed. Over the nineties, there has been growing marginalization of labour with a decline in the share of main workers. In fact, in this period, annual compound growth rate of population had been higher than the annual compound growth rate of the number of main workers. Thus the rate of growth of productive employment generated in the district had not been able to keep pace with the rate of growth of population in the district. Though the blocks of the district are predominantly rural in nature but agriculture is no longer the main source of livelihood for the people residing here. In 2001 only 36 per cent of the workers could depend on agriculture as their main source of livelihood compared to 58 per cent in 1991. It is indeed a matter of concern that the decline has been perceived not just in the percentage of agricultural main workers but also in the absolute number of such workers by about 2.6 lakhs. This implies that rural population in the district is more and more unable to take up agriculture as their main source of living. Such a phenomenon tallies with the observation that the blocks that have high dependence on agriculture as the main source of living are generally those very blocks that have registered high incidence of poverty. Thus there is a high correlation between the dependence on agriculture and incidence of poverty at the block level. It is therefore no wonder that the rural households are diversifying away from agriculture in the district. In fact, a large percentage of the households are pushed into relatively more vulnerable uncertain activities. The Rural Household Survey (2005) reveals that the main sources of sustenance for as many as 51 per cent of the rural households are daily/ agricultural/ other physical labour with no more than 12 per cent households being involved in high return regular jobs in the organized or in production and services sector. Of course, dependence on income from regular jobs is positively associated with the closeness to Kolkata metropolis.

A detailed analysis of the employment trends, occupational diversification and livelihood pattern of the district both at the block level as well as the municipality level is reviewed in the sections 4.2, 4.3 and 4.4 respectively. In section 4.5 we look at the potential alternatives for enhancement of employment opportunities in the district. Section 4.6 concludes. The secondary data used in this chapter have been collected from various sources such as the Census of India decennial reports 1991 and 2001, Rural Household Survey data of the Government of West Bengal - 2005 for this district and data furnished by different departments of the district administration.
4.2 Employment Trends

4.2.1 The District Level

As a first step towards understanding the employment scenario in the district, it is important to look at the share of workers in the total population of the district. As is well known, Census of India while enumerating the number of workers in the decennial enquiries uses concepts of main workers and marginal workers. Main workers are those who have worked for the major part of the year preceding the date of enumeration, i.e. those who were engaged in economically productive activity for 183 days or more. Marginal workers are those who worked anytime at all in the year preceding the date of enumeration but did not work for the major part of the year, i.e. those who worked for less than 183 days. From Table 4.1 it can be seen that in 2001, out of the total population in the district only about one-third (32.47 per cent) worked either as main or as marginal worker. If we consider only main workers, then productive population is only about one-fourth of the total population (24.30 per cent) of the district.

Considering the share of male and female workers in the population separately, the discrimination in terms of working status is obvious. Female work participation rate is very low in the district as compared to the male. From Tables 4.2 and 4.3, one can find that in 2001, while the worker population ratio for the male workers (main + marginal) was 51.82 per cent, only 11.83 per cent of the female population was engaged in any economic activity either as main worker or as marginal worker. If we leave out workers in the marginal capacity and consider only main workers i.e., those who work for more than 183 days in a year then gender discrimination becomes even more striking. Only 5 per cent of the total female population in the district worked as main worker as compared to 42 per cent in case of male workers. Rural-urban break up of employment in the population shows lower share of employment in the rural areas compared to the urban areas both for the male as well as the female.

Although minimal participation of female population in economic activity is striking, this is not surprising in the context of West Bengal because this state has one of the lowest recorded rates of female work participation in the country. Percentage of female main workers in 2001 was 8.87 in the rural areas and 8.82 in the urban areas of West Bengal. As has been rightly pointed out in the West Bengal Human Development Report, 2004 that such low work participation rate for women is an evidence of gender discrimination not only because they reflect

resistance to women working outside their home but also it may reflect under-reporting due to social invisibility and lack of recognition of women’s unpaid work.

Even when we look at the proportion of female workers in total workers of the district we once again find their dismal representation. Genderwise distribution of workers in the district (Table 4.4) reveals that in 2001 only 17.62 per cent of total

Source: Census of India 1991, 2001
(main + marginal) workers were female. However, female participation has somewhat improved in the decade of nineties. In 1991 female main workers formed only one-twentieth of the total main workers. The ratio has at least increased to about one-tenth of the workers in 2001. Comparing the employment situation of 2001 over 1991, share of workers in the population of the district has increased by 4.18 percentage points in a period of ten years. Apparently the change signals an enhancement in the achievement level of the district in terms of employment creation. A closer examination, however, reveals that the increase in worker population ratio has been brought about by growing marginalization of labour, particularly in the rural areas. In fact, a notable point is that the percentage of main workers has actually dropped from 26.09 per cent in 1991 to 24.30 per cent in 2001. But the percentage of marginal workers increased from 2.20 per cent to 8.18 per cent in this period. So
the increase in share of workers is attributable to the increase in the share of marginal workers rather than main workers. It is a matter of concern indeed that the percentage of male main workers in South 24 Parganas has dropped by about 6 percentage points between 1991 and 2001 particularly in the rural areas from 47.78 per cent to 41.46 per cent. This trend is similar to what has been happening in the state as a whole. As has been reported in West Bengal Human Development Report 2004, the ratio of male main workers to total male population in the rural areas fell quite significantly over the decade from 51.18 per cent in 1991 to 46.00 per cent in 2001.

If one looks at the annual compound growth rate of the total population vis-à-vis employment generation in the district then one can easily identify the shortfall of additional employment generated in keeping pace with the growing population (Figure 4.1). This is more so for the rural areas as compared to the urban. Gender wise breakup of this difference in growth rate of population and employment further reveals that the shortfall in the rate of employment generation has been more prominent for the male workers as compared to the females (Figures 4.2 and 4.3).

4.2.2 The Sub-district Level

As has been mentioned earlier there exists wide variation in the topography of the district. Accordingly, for a better insight of the employment scenario in the district we further consider the disaggregated block/municipality wise distribution of workers. In 1991, the district had 30 administrative blocks and 5 municipalities. There had been administrative redistribution between 1991 and 2001 so that in 2001 there were 29 blocks and 7 municipalities. Areas of the Mahestala and Thakurpukur-Metiabruz blocks in 1991 were redistributed to form Thakurpukur-Mahestala block in 2001 and two other municipalities namely Mahestala and Pujali. So it is difficult to compare the performance of the blocks/municipalities with one to one correspondence over time. However, one can always study the variation over the cross section of blocks/municipalities at a particular point of time.

Using data published by Census of India 1991 and 2001 it can be seen from Tables 4.5 and 4.6 that there has been wide variation in the worker population ratio across blocks. The inter-block variation in worker population ratios has been more prominent among female workers compared to the male. Of course, female participation in all the blocks is much lower compared to the male. Out of the 29 blocks in the district, in 2001, male worker population ratio was a minimum at 48.44 per cent in Mathurapur I with a maximum of 55.96 per cent in Namkhana. In case of female workers Mathurapur I had lowest female work participation rate at 5.60 per cent, while blocks such as Patharpratima,

Source: Census of India 2001
Namkhana and Sagar had nearly one-third of the female population engaged in some form of economic activity. It is no mere coincidence that the blocks with high female work participation rates are the blocks which have very high percentage of female marginal workers. This implies that in these blocks more and more women are getting involved in income earning activities over and above their household responsibilities even for a smaller part of time in a day. Patharpratima, Sagar and Namkhana which are indicating high work participation rate for the female are also the three blocks in South 24 Parganas which rank first, fourth and fifth in terms of number of persons engaged in pisciculture (see Table 4.20 in section 4.5.2 of this chapter). The most likely activity that these women are getting more and more involved into is collecting shrimp fry from streams which are later sold in the market. These marginal activities help the women to contribute to the family income thereby enhancing their family earning in addition to their contribution in household work.

As in other chapters of this report, the 29 blocks of the district are further classified into three regions, depending on the perceived notion of development that is likely to have taken place: Region I representing the blocks closer to the metropolitan centre with better infrastructure, Region III covering mainly the Sundarbans consisting of the riverine blocks of the district in extreme South and Region II locationally representing the central region of the district.

The regionwise break up of workers shows that in 2001 all the three regions on an average had no less than half of the male population engaged in some form of economic activity with region I registering the highest share of employment. In case of female workers however, Region III has almost double work participation rate (16.40 %) compared to Region I (9.88 %) and Region II (8.07%). The phenomenon of high female participation in Region III can probably be explained to a certain extent by the rising prospect of pisciculture in the region where the women members of the family are being engaged on marginal basis.

Table 4.8 shows that in the municipal areas no less than 52 per cent of the male population were engaged in economic activity in 2001. Very little variation is registered in male work participation rate across municipalities. In case of women, work participation rate is once again low varying between 4.46 per cent in Budge Budge to 12.17 percent in Rajpur-Sonarpur municipality. The gender gap in work participation rate is evident even in municipal areas. In fact, female work participation rate in many blocks of rural Sundarbans is much higher than the participation rate of women in the municipal areas.

### 4.3 Occupational Diversification

#### 4.3.1 The District Level

Given the work participation trends of the district, it is important to identify the type of employment in which the workforce is absorbed. In the labour market, the obvious source of employment is either the agricultural sector or the non-agricultural sector. Predominantly rural economies are characterized by large dependence on agriculture as the main source of employment if not the main source of income. On the other hand, increasingly greater dependence on non-agricultural sector i.e. the structural transformation of employment from the agricultural sector to the non-agricultural sector is often seen as a precursor of development in the economic literature. However, it is important to identify whether such structural transformation is due to progressive labour saving technique of productive agriculture releasing labour which can be readily absorbed in the modern industrial sector, or it is the distress in agriculture that is pushing workers out of it into a semi-saturated non-agricultural

Source: Census of India 1991, 2001
sector often characterized by low return.

In the district of South 24 Parganas, about 84 per cent of the population resided in the rural areas in 2001. So the district is predominantly rural in nature. As is expected in a rural economy, agriculture had been the main source of employment in the district over time. The scenario has, however, changed completely by the turn of this century. Agriculture is no longer the main source of employment or earning in the district. In 2001, majority (about 58 per cent) of the total workers (main + marginal) were employed in the non-agricultural sector. The situation was just the reverse in 1991, when majority (nearly 59 per cent) of the workers in the district were engaged in the agricultural sector (Figure 4.5). So there has been a decline in the share of agricultural workers (i.e. cultivators and agricultural labourers) by 17 percentage points over the decade of nineties. Considering main workers only, the decline in percentage of agricultural workers has been far more striking. In 1991 nearly 58 per cent of the workers had agriculture as

Source: Census of India 1991, 2001
their main occupation. Compared to this, in 2001, only 36 per cent of the workers could depend on agriculture as their main source of livelihood (Figure 4.4). This current trend of relatively less dependence on agriculture holds both for male and female workers. Thus by 2001 agriculture was no longer the main source of employment in the district as it was till 1991 – neither for the men nor for the women.

If decline in the percentage of agricultural workers is precursor to development, then no doubt that the district of South 24 Parganas has seen such occupational diversification away from agriculture. However, a note of caution that needs to be sounded here is the fact that together with a drop in the percentage of agricultural workers, absolute number of agricultural workers (both for main and main plus marginal workers) in the district dropped between 1991 and 2001. For the main workers only, the number of agricultural workers dropped drastically by about 2.6 lakhs from 858567 in 1991 to 598661 in 2001.

Considering marginal workers in addition to main workers, the shrink in absolute number of agricultural workers is relatively less as the drop in number of cultivators in this period is largely compensated by the increase in the number of agricultural labourers. So it is obvious that instead of taking agriculture as the main source of employment, a large section of the workers are increasingly considering it as a marginal occupation to supplement income from some form of non-agricultural employment and income as the main source of living.

Agriculture is no longer able to provide a sustainable year round income to a large part of the working population. This can partly be explained by the constraints faced by agriculture in the district. Out of the 4,06,215 hectares of cultivable area in the district only 1,60,217 hectares of land is cropped more
than once resulting in a low cropping intensity (141.20%) in the district. The mono-cropping pattern of cultivation is followed largely because of poor irrigation facilities and high soil salinity. Being close to the Bay of Bengal, the river waters are saline and are mostly unsuitable for the purpose of irrigation. As a result, minor irrigation particularly canal and tank irrigation remains the most important source of irrigated water in the district. Moreover, frequent floods is a major problem in a large part of the district – particularly so in the islands located in the Sundarban region. The major crop grown in the district is Aman Paddy. Although rice is the principal crop, cultivation of other crops such as cereals, oilseeds, cotton, jute, watermelons and other fruits and vegetables is steadily on the rise.

A pertinent question that arises at this juncture is that while the absence of intensive cultivation owing to constraints of low cropping intensity followed by poor irrigational facility had always been there in the district, the rapid occupational diversification towards the non-agricultural sector is a relatively new phenomenon. This can perhaps be explained by changes in broader macroeconomic perspective that has been taking place in the country as a whole. The shift from agriculture in the post-liberalization era particularly after the macro-economic policies like withdrawal of subsidies from agriculture has become a common feature in many Indian states. Such policies have resulted in increasing cost of agricultural production. But the market prices of crops, particularly food-grains, did not escalate to the extent of rise in the cost of production. As a result, return from agriculture began to decline. Following this, a large section of the existing cultivators faced with constraints in agriculture were unable to derive their livelihood from only agriculture. As a result, not just the percentage of agricultural workers but the absolute number of agricultural workers in the district is also declining. So in the rural areas, agricultural employment is no more the prime economic source of sustenance. It is largely acting as a supplementary income to some form of non-agricultural income.

The likely explanation of occupational diversification away from agriculture thus points towards low return from agriculture, sole dependence on which often leads to poverty. Thereby comes up the hypothesis that greater dependence on agriculture is positively associated with higher incidence of poverty. The hypothesis needs to be tested empirically. The hypothesis is tested by identifying the relationship, if any, between the level of poverty and the

Source: Census of India, 2001

The table shows the percentage of agricultural workers at the block level. In order to test the hypothesis over the cross section, data on poverty at the block level is required. Now the conventional measure of poverty is based on the existence of a threshold level of per capita income. Failure in achieving this minimum level of income is said to signify
poverty. Then a head-count measure is commonly made to identify the percentage share of poor in the population. Since it is well known that income data required for the head-count ratio is unavailable at the block level, so a proxy measure is used to calculate poverty of the households at the block level. The estimation is based on data from Rural Household Survey (RHS) undertaken by the Government of West Bengal in 2005. The parameters on which information are available
in the RHS and the nature of that information are discussed in Chapter 2 of this report.

A distinction between the poor and non-poor households is made on the basis of the score they achieve out of a possible maximum of 60. A household getting less than or equal to 33 (determined by the Planning Commission of India) on the achievement scale is considered to be a poor household. In this way the total number of households scoring less than or equal to 33 out of the total number of households in each block can be found out. The details of percentage of households lying below the poverty line are discussed in the previous chapter.

Finally, after obtaining the information on household level poverty across the blocks, we try to identify if there is at all

Figure 4.8: Percentage Shares of Main Workers in Agriculture and Non-agriculture in different Blocks
any observable correlation between the dependence on agriculture and incidence of poverty among households in 29 blocks. For this we calculate the rank correlation coefficient between percentage of agricultural main workers and percentage of households below poverty line in the blocks. The result found is a positive relationship (Figure 4.6) between the two variables with statistical significance at 1 per cent. In fact, the rank correlation coefficient between percentage of agricultural workers and percentage of households below poverty line is 0.627. The hypothesis is thus accepted implying greater dependence on agriculture is associated with higher incidence of poverty.

Figure 4.6 depicts the relationship between incidence of agricultural main workers and percentage of households below poverty line. It can be seen in the diagram that, on the whole, the blocks that have high incidence of agricultural workers are mostly the blocks that are associated with higher incidence of poverty among households.

If we consider distribution of workers in the agricultural and non-agricultural sectors by blocks, obviously wide variation can be seen though the trend of transformation towards the non-agricultural sector holds everywhere. In fact the regionwise classification of blocks with regard to dependence on agriculture gives distinctly different pictures of the three regions (Tables 4.15 and 4.16). Expectedly in the blocks of Region I situated in the close proximity of the Kolkata metropolis, overwhelming majority are involved in the non-agricultural sector for their livelihood. Percentage of non-agricultural main workers increased from 66 per cent to 77 per cent in the decade of nineties in this region (Tables 4.17 and 4.18). In Budge Budge I as many as 91 per cent of the population were engaged in non-agricultural activities in 2001 (Table 4.18). Also large areas of Mahestala and Thakurpukur-Metiabruz have high dependence on non-agricultural sector. So this region shows the characteristics of a semi-transformed or semi-urban economy.

The situation in Region III is just the reverse. Here majority of the working population draws their livelihood from the agricultural sector though the structural transformation in favour of non-agricultural sector is also in progress in the blocks of this region covering the Sundarbans. In 1991, 76 per cent of the working population depended on agriculture here (Table 4.17). The same figure came down to 56 per cent in 2001 (Table 4.18). Although blocks like Canning-I, Joynagar-I and Mathurapur-I have greater dependence on non-agricultural sector, the blocks like Canning-II, Basanti,
Kultali in this region had more than 70 per cent of the main workforce engaged in agriculture even in 2001 (Table 4.18). So in a way region III is predominantly rural and backward in nature.

In the blocks of Region II there is once again pre-dominance of non-agricultural employment. Though these blocks are not necessarily very close to Kolkata, a large number of them are well connected with the urban centers. As a result, some medium and large scale industries including a special economic Zone has developed in the areas of Falta and Diamond Harbour block of this region. Also being well connected through roads and railways from many blocks of this region, on the one hand it becomes easier to commute regularly for employment to the urban centres while residing in the rural areas; on the other hand, better road connection leads to better marketing channels for homegrown products. As a result 66 per cent of the main workers in this region depended on the non-agricultural sector in 2001 (Table 4.18). This region may be identified as the transforming region of the district.

Overall, dependence on agriculture in the district is on decline irrespective of distance from Kolkata metropolis. Of course, the extent of transformation varies across regions. As a corollary to decline in the percentage of employment generated in the agricultural sector obviously there has been expansion of non-agricultural activities in the district. The increase in non-agricultural employment is evident not only in percentage terms but also in absolute number. The number of non-agricultural workers in the main plus marginal category almost doubled from 663908 to 1296634 between 1991 and 2001 in the district. The Census of India further classifies non-agricultural workers as household industry workers and other workers. According to the census data, shifting towards the non-agricultural sector in this district has been more for other workers with a nominal increase in the share of household industry workers. So far as employment in quantitative terms is concerned, no doubt non-agricultural sector has absorbed greater number of labourers into it than it could do before. Whether this increased absorption of work force into the non-agricultural sector is the outcome of a vibrant “pull effect” of this sector or it is the “push effect” from agriculture which is dominating in the process of transformation, needs to be identified. In addition to the increase in quantity of employment generated in the non-agricultural sector, it is very important to identify the quality i.e., sustainability of the type of employment generated. Given
unavailability of any further break-up of Census data on exactly the type of employment generated based on the return from such employment, further probe in to the process of diversification of employment is done in the following section of livelihood strategies using RHS (2005) data for the district.

4.4 Livelihood Patterns

Contrary to the prototypical image of being purely dependent on either agriculture or non-agriculture, in reality the rural households rely on many activities and income sources for their livelihood. The rural economy is highly diversified depending on a range of activities from agriculture and allied activities i.e., from farm to the non-farm sector. The non-farm sector may include a variety of activities starting with those that are allied and complementary to agriculture or those that are not related to agriculture at all. It may be one of high return jobs requiring skill or a low return job which people are forced to pursue owing to their distress conditions. Within this diversified rural economy, a large part of household income comes from combined incomes from the different household members, each often specializing in one occupation. In case of low return activities particularly in the non-agricultural sector individuals even pursue different activities at the same time to smooth their income. The return on many of these activities is low and the diversity of occupations does not always transform into income diversification implying that one activity may be the dominant source of income.

In the Rural Household Survey of this district, the dominant income sources of the households have been used to classify rural households according to five different livelihood strategies. Some households derive the larger part of their incomes from wage work as daily labourer in the agricultural or non-agricultural sector which is seasonal and volatile in nature (daily / agricultural / other physical labourer). There are some landed households whose livelihood depends primarily on farming though they may use majority of their produce for home consumption (cultivators). There are others who are neither cultivators nor daily labourers but are self-employed in the rural non-farm sector like artisans or hawkers. They may include family members in the work but as such do not employ others (self-employed rural artisan / hawkers who do not employ others). There are still others who derive
their main income through their employment as labour in the unorganized non-agricultural sector which is fairly regular in nature (*labour oriented job in the unorganized sector*). Finally, some households have members in the family who are either employed in the formal organized sector or are established as a medical practitioner or advocate or in own business or production agency (*others*).

Based on the above-mentioned five-way classification of livelihood, the major income generating activity database of the households in the district of South 24 Parganas reveals that for 51 per cent of the households, wage labour in the agricultural sector or in the informal non-agricultural sector is the main source of livelihood (Figure 4.9). Given the seasonality of agriculture and volatility of daily wage activities in the informal sector the return from this particular livelihood strategy is supposed to be least stable among the five strategies. Thus one might say that no less than half of the households in the district are economically vulnerable. Only 20 per cent of the households depend primarily on cultivation for their living. Not more than 12 per cent households in the district were involved in high return regular jobs in the organized sector or in some form of activities like business or production or services that fetch relatively high income. So, the fact that there has

*Source: Rural Household Survey 2005, Government of West Bengal*
been considerable amount of occupational diversification towards the non-agricultural sector in the district does not necessarily mean that the surplus labourer in agriculture is pulled into a flourishing non-agricultural sector. Otherwise, 51 per cent of the households in the district would not have derived their living from low return daily wage labour.

Region-wise break up of the livelihood pattern of the households shows some variation with similar trend of large dependence on daily physical labour either in the agriculture or in the non-agriculture and less dependence on regular jobs either in the unorganized sector or in the organized sector (Figure 4.10). Deriving livelihood from the earnings of wage labourer or of a cultivator is relatively more common in Region III. On the other hand, accessing income from some form of regular jobs is relatively more common in region I compared to Region II or Region III, mostly due to its closeness to the urban centres where more job opportunities are expected to be available. Though the livelihood patterns show similarity across regions, it is easy to perceive wide variation across blocks from Table 4.19.

4.5 Potential Alternatives

Rural households design livelihood strategies to suit their asset endowments and account for the constraints imposed by market failures, state failures, social norms and exposures to uninsured risks. But their strategies compensate for only part of the constraints they operate under, leaving important roles for improvements in their access to assets and in the contexts for using these assets. The key, then, is to enhance collective action and mobilize public policy to maximise the livelihood of success for rural households. The daunting challenge for the policy makers is, therefore, to design public policies that can improve the living conditions of the rural households. In this context we highlight some of the potential alternatives of the district where policy intervention can lead to further employment generation and thereby improve the livelihood condition of the people.

4.5.1 Agriculture

We, first of all, emphasize the need for tapping the potential of agriculture to the fullest. As has been discussed earlier, dependence on agriculture in the district is on decline. Agricultural work-force in the district has declined not only relatively but also absolutely. This is mostly due to low return followed by mono-cropping
pattern in agriculture of the district. Policies need to be taken for making agriculture more remunerative. For this, further technological percolation, particularly better irrigational facilities in rural areas, is required. This can increase the cropping intensity by allowing multiple cropping. Multiple cropping will, first of all lead to higher employment opportunities in the farm sector and to increase farm income, which, in turn, is likely to create a further consumption linkage into the non-farm sector by creating higher demand for locally produced goods and services. Expectationally there will be a ‘demand pull’ growth of the rural non-farm sector.

Facilitating irrigation would also promote intensive farming through agricultural crop diversification. In addition to increasing farm employment and income by ensuring year round employment opportunities and more remunerative prices, crop diversification can lead to forward production linkage into the non-farm sector too. A big share of non-farm jobs in the rural areas is very unproductive and unremunerative. Rural workers have to take up these jobs as a result of the lack of sufficient year-round jobs in the farm sector. Multiple cropping and crop diversification would allow the rural workers to get higher employment days in the farm sector and reduce distress diversification. This will also lead to a more productive non-farm employment through various linkage effects.

Horticulture including floriculture activities offer considerable potential for employment generation and productivity growth in the district. For example, sunflower is being successfully cultivated in some areas of the district. Such cultivation is particularly made after boro cultivation in those areas where there is availability of irrigation. Enhancement of irrigational facility can spread the cultivation of such crops in addition to the major crops like paddy grown in the district.

To reap the fruits of such crop diversification, however, development of agro-based industries in the rural areas is a necessity. Very little has been done in this regard. The development of rural infrastructure with proper marketing and storage facilities is a necessary prerequisite for successful rural agro-based industries. Moreover, the conditions of rural roads are often so bad that proper transportation of the output to export even to the neighbouring states is not feasible. The problem is more acute in the island blocks of the Sundarbans. The lack of infrastructure sometimes leads to huge loss on the part of the cultivators. For example, guava and lichee produced in Baruipur, mango in Bhangar, watermelon in
Kakdwip and Sagar, chilli in Patharpratima are widely known for their good quality. With good storage, transport and marketing facilities these non-foodgrain crops could be sold in distant places and could be highly remunerative.

4.5.2 Non-agriculture

(i) Pisciculture

Within the non-agricultural sector an important source of employment which is worth-mentioning, particularly in the district of South 24 Parganas, is pisciculture. This is the natural outcome of the closeness of the district to the Bay of Bengal. The confluence of river Hooghly with the sea here is congenial to pisciculture. A large area of the district is riverine in nature. So the basic economics of the rural people residing particularly in delta islands and the areas near the Sundarbans are mainly based upon prawn seed collection and production and also fishing. Culture of coloured and ornamental fish has become popular in some parts of the district. The prospect of pisciculture in the district is excellent.

According to the District Statistical Handbook, 2004, for South 24 Parganas not less than 4.5 lakh persons in the district are engaged in pisciculture. Out of this, 2.57 lakhs are from the 13 blocks of the Sundarbans. Even though a large number of persons are engaged in pisciculture, the capacity is far from being fully utilised. As can be seen from Table 4.20, only 39 per cent of the net area available for pisciculture in the district have been utilised so far. A region-wise break up of the same shows that area available for pisciculture are 11778, 27483 and 77063 hectares in Regions I, II and III respectively. But only 36 per cent, 38 per cent and 40 per cent of the area available respectively for pisciculture in these three regions has been effectively utilised.

The maximum area available for pisciculture are in the blocks of Canning I and II followed by Patharpratima, Sagar, Gosaba, Kultali, Namkhana and Kakdwip in the Sundarbans. Canning is the gateway to the Sundarbans. It is situated on the south bank of the Matla River. Being part of the Kolkata Suburban Railway system and connected to Sealdah station as also to
Kolkata by road, Canning has emerged as a major market for supply of fish to Kolkata. The fishermen of the area bring their catch to the all-night fish market at Canning. Here the commission agents receive the fish and auction them. It is bought by the wholesalers and transported to Kolkata for sale to retailers, who sell it in different markets. However, as greater part of Kolkata’s fish now come from South India and Madhya Pradesh, local wholesale trade at Canning has been lost out in the competition. There is, of course, scope of reviving this market once again. A large part of the area available for pisciculture in the district particularly in the Sundarbans can be brought into effective use. Proper policies to enhance employment generation in this sector need to be taken. Such policies together with orientation for sustainable development to ensure renewal of natural resources can benefit the rural population to a large extent in the district.

Livestock and animal husbandry, poultry hatching, farming and processing, meat processing, fish processing (frozen and dehydrated fish), dairy farming and milk processing can be some other alternatives.

Box 4.1: How life has changed for Swarup Patra!

Life has changed for Swarup Patra. When he looks back at the struggling old days of his and his family he wishes that those who are struggling today be inspired with his way of life now. Swarup had to struggle a lot to complete his studies as a graduate while staying in their mud house near Dighirpar Bazar at Daulatpur village of Falta. His father was the only earning member with unstable income supporting a family of five. He being the elder son of the family tried his best to go on with his studies so that he could do something in the near future to help his family. After graduation he became a private tutor to earn about Rs. 2000 per month. Though this income was unstable even then it gave some amount of stability to their struggling family. When he came to know about ornamental fishery i.e., culture and marketing of fish that are kept in aquarium, he thought of starting a business with the same to supplement his unstable income that supported his family.

Swarup started ornamental fish culture in 2003 with four varieties of coloured fish. Then he got training on ornamental fish culture and breeding etc. from the District Fisheries Department. This technical assistance, together with financial support through government subsidy and bank loan, has made him successful and established ornamental fish farmer at the age of thirty today. At present, he cultures about ten varieties of coloured fishes of which four varieties are produced in his own farm. In addition to culture and production he procures fishes from local farmers (individuals and co-operative societies) and supplies to bigger market at Howrah and Jabalpur. His present income from fish culture even after repaying installments of loan regularly and other cost of production is Rs. 7000 to Rs. 8000 per month. Now they have a pucca house to stay. He has his own breeding farm which is just about to be converted into a bigger one with MPEDA assistance. His entrepreneurship has forced him to undergo a Certificate Course on ornamental fish culture which will help him to grow his farm even bigger. Swarup is happy to say that he employs two other boys of his locality in his farm whose families depend on their income too. He wishes that not just increasing his own farm income but the growth of his farm may help his locality by creating a source of livelihood for many others also.

Box 4.2: Development of a remote low-lying area through Integrated Fish Farming:
Satyendranath Malik, Dibakar Dalui, Gurupada Bar, Tulsi Charan Mondal, Shyamal Pramanik like many others are residents of some of the remotely located villages such as Magurpukur, Purba Ramnathpur or Kamarpukur within Amratala Gram Panchayet of Magrahat II block. The nearest railway station Dhamua on the Sealdah – Diamond Harbour railway line lies at a distance of about 3 kilometres. The nearest bus route to Kolkata lies at a distance of 6 kilometres from this area. These villages fall under a low-lying area where water-logging is a common phenomenon every year. As a result, cultivation of Aman Paddy – the major crop of the district - is not possible in these areas. To overcome this problem, a few local fish farmers started Integrated Fish Farming some twenty years back. Later on, a section of the pisciculturists came under the purview of Inland Fisheries Project of the government. Grass-root-level fishery training was imparted to them through Magrahat-II Panchayat Samity. The method of integrated fish farming was extended to other fish farmers of the locality also. Integrated fish farming is going on in the area in a sustainable way with the plantation of banana trees on the embankment along with pisciculture in the water body with compost manure. Most of the farms are rectangular in shape having an area of 0.5 hectare to 1 hectare. Multiple stocking and multiple harvesting is being carried out in the farms. Liberation of fish fingerlings 4 to 6 inches is made 2-3 times and harvesting is done 2-3 times in a year. Production of fish is more than 5-6 metric tons per year per hectare of water body. This, together with the banana plantation on the embankment of the farms, is fetching no less than Rs. 25000 to Rs. 30000 per hectare per year to the farmers of the area. The fish farmers are now carrying out integrated fish farming successfully in the area. In fact, Satyendranath Malik, one of the poor villagers, who took initiative in integrated fish farming to overcome the problem of water-logging in the area some twenty years back has got the first prize in fish production in the district of South 24 Parganas in 2004-2005. The area as a whole has been uplifted socially and economically through the entrepreneurship of the villagers and the co-operation from Panchayat body, Government officers of the district as well as the concerned banks.

(ii) Tourism Industry

Presently the tourism industry has earned prominence in the southern pockets of South 24 Parganas. Tourism can be a supplement to a part of the financial set up of the district. The tourism industry centers round the places like the Sundarbans, Sajnekhali, Bakkhali, Frazerganj, Henry Island and Diamond Harbour.

The tourism in the Sundarbans focusses on the vast tract of forest and the swampy land forming the lower part of the Ganga delta. The Sundarbans is the largest river delta in the world and also the largest estuarine mangrove forest in the world. The principal attraction of the Sundarbans is the network of estuaries and the Royal Bengal Tiger. The Sundarbans is named so because the area is infested with the “forest of sundari”. The shallow swampy coastal area is crocodile-infested and is virtually uninhabited. The world’s largest delta region, the Sundarbans, spreads over two countries (India and Bangladesh) and over 54 islands. The Sundarbans present a unique ecosystem in this part of the world. The Sundarbans is declared by UNESCO as a heritage site. It holds the largest number of wild tigers in its core. The Sundarbans is the key interest of tourism in South 24
Parganas. The scenic beauty and the bird sanctuary is the primary attraction of the Sajnekhali division. The Mangrove Interpretation Centre is also of interest to the visitors. There are watch-towers in the Sajnekhali region and in the adjacent parts.

Bakkhali beach resort by the Bay of Bengal is only 132 kms from Kolkata. Very close to Bakkhali, there is Frazerganj beach resort, which is equally important as a tourist spot and also one of the fishing harbours of the district. Henry island near Bakkhali is also attracting tourists in the recent times.

Diamond Harbour located by the river Hooghly is a famous picnic spot because of its close proximity with Kolkata. The Diamond Harbour Road, which connects the town with Kolkata, has a number of lodges and resorts on the highway. Resort Radisson Fort is very close to Diamond Harbour and situated at Raichak, while the Export Promotion Zone of Falta is just 20 minutes away. This luxurious resort is located amidst 60 acres of landscaped greenery including artificial water bodies and a moat running around the resort to complement its fort theme and overlooks a dramatic bend of the river Hooghly.

Gangasagar is also a focus of tourist interest, specially on the occasion of Makar Sankranti. Thousands of devotees come to visit it and take a dip at the river-sea confluence and offer worship in the temple of Kapil Muni on the occasion of Makar Sankranti. A big colourful fair, called Sagar Mela, is organized on that occasion.

(iii) Industry

Despite its proximity to Kolkata, the district has not been developed industrially. Except for the Budge Budge stretch and Metiabruz area, adjacent to Thakurpukur Mahestala block, there are no major industrial areas. However, some major industries have come up in the Falta export-processing zone. Falta Special Economic Zone is one of the eight Special Economic Zones of the Govt. of India, Ministry of Commerce & Industry, under the SEZ scheme. With a gross area of 280 acres in the Panchayat area of Falta block, the Falta Special Economic Zone is located in a pollution free environment, at a distance of about 55 kilometres from the heart of Calcutta city and about 45 kilometres from the southern suburbs. It is well connected by a developed network of roads including a state highway, two ports at Calcutta and Haldia and the International airport at Dum Dum. The units in the Zone have to export their entire production and are granted certain entitlements such as Duty Deferment on Import & domestic procurement, simplified operational regime, and access to the DTA market.
In 2004 there was another proposal to set up a special economic zone for leather and allied industries within the upcoming Leather Complex at Bantala, only 15 kilometres from the heart of Kolkata. The Rs. 350 crore complex, which is regarded as the largest of its kind in the world is spread over 1,100 acres. The leather complex was conceived in 1995-96 as a part of the Supreme Court directive against 500-odd highly polluting tanneries in the eastern fringes of Kolkata. Accordingly, a plan was made to shift the tanneries to an integrated complex containing common effluent treatment plants and other infrastructure facilities to avoid air and water pollution. In due course, however, the scope of the project was expanded towards attracting investment in leather and allied sectors from India and abroad. Out of a total of 1,100 acres about one half was used for providing infrastructure including roads, electricity, effluent treatment, processed water and other utility services. The rest of the space is used for industrial purposes. Of the same, about 320 acres is reserved for shifting the existing tanneries from Kolkata and new investments in the leather sector. The SEZ would occupy about 110 acres.

CESC Ltd. has taken up a 500 MW thermal power plant project at Pujali. A bottling plant at Budge Budge has started working. The Budge Budge stretch has five jute mills on the banks of the Hooghly river and the famous Bata shoe factory. Some small and medium factories are located in Mahestdala and Birlapur, while others are situated along the Garia-Baruipur Road, Diamond Harbour Road and Thakurpukur-Bakrahhat Road.

(iv) Small Scale Industries and Handicraft Activities

The prospect of small scale industries and emerging handicraft activities in the district is immense. Different areas of the district are increasingly forming clusters of handicraft activities that are marketed not only within the state but also exported.

Some of the very popular clusters of handicraft activities in the district are those of surgical instruments, batik print, decorative palm leaf products, silver filigree, terracotta, embroidery works, kantha stitch, soft dolls, feather products (like magic flower, dusters, artistic products, cock neck etc.), dak foil, zari work, cane and bamboo products, jute products, different types of brush, sola pith, pottery, shaving brush handle, cane furniture, dry flowers, and turban (Arabian) which is an exportable item. These different types of handicraft activities are employing more and more local people and are increasingly taking the form of household industry in the district. The fact that the incidence of such activities, increasing can
be verified through the large increase in the number of small units registered with the District Industrial Centre. Owing to lack of capital, however, there are often constraints in initiating new businesses by the rural households. The government has to take greater initiative here by providing financial assistance for start-up capital. Small industrial estates with different infrastructural facilities might be set up in some viable rural areas of the district, which can act as “growth poles” and stimulate local economic activities. The present spread of small scale industries in the district of South 24 Parganas is shown in Figure 4.12.

(v) Government Support Programmes

a. Self-employment through Self Help Groups

Reduction of poverty has been long emphasized strategy of the planners in India. Accordingly numerous target-oriented programmes have been undertaken from time to time by the Government of India for eradication of poverty. Mostly employment generation programmes for the poor persons have been the strategy taken for poverty reduction. Some of the earlier poverty alleviation programmes include Integrated Rural Development Programme (IRDP), Training Rural Youth for Self-employment (TRYSEM), Development of Women and Children in Rural Areas (DWCRA), Supply of Toolkits in Rural Areas (SITRA), Ganga Kalyan Yojana (GKY), Million Wells Scheme (MWS) and others.

In recent times, however, providing credit to the poor persons, however small the amount might be, is considered as an important means to poverty reduction. The Indian microfinance has been trying for formal financial inclusion of poor households for quite a some time. Accordingly formation of self-help groups bank linkage programme (SBLP) is used as tool for advancing credit to start-up production. In addition to the SBLP model of progress in SHGs, the other most important form of self-help group introduced by the government that directly emphasizes creation of self-employment for the poor households is “Swarnajayanti Gram Swarozgar Yojana”, or SGSY. The previously existing poverty alleviation schemes are no longer effective since the initiation of SGSY in April 1999.

The core strategy of SHG – Bank Linkage Programme (SBLP) is building financial capabilities and self-confidence among the rural poor, through internal savings and lending from the owned funds of the SHGs as well as from formal financial intermediaries. The first official interest in informal group lending in India
Figure 4.12: Spread of Small Scale Industries in South 24 Parganas
took shape during 1986-87 in the initiative of the National Bank for Agriculture and Rural Development (NABARD). However, it was only in 1992 that legal obstacles were removed and subsidies made available so that SHGs could take bulk loans from banks that could be further lent to group members who could use them to take up or expand micro-business. The financial intermediaries, mainly the commercial banks, regional rural banks and cooperative banks were allowed to count such lending towards their legal obligations to direct a fraction of their loans to the poor, and they were given access to subsidized NABARD refinancing to do so. This marked the gateway of mainstreaming of Indian microfinance. Growth in the number of SHGs formed, and the scale of their interaction with banks, has been very fast particularly since the turn of this century.

According to the data published by NABARD in March 2006, out of the total number of SHGs linked to banks in India 6.09 per cent belonged to West Bengal. However, the amount of loan received is fairly conservative at 2.13 per cent of total loan disbursed by banks in India. Within West Bengal about 9 per cent of SHGs have been credit linked to banks in the district of South 24 Parganas. As can be seen from Table 4.21, about 12487 SHGs were credit linked to banks in the district by March 2006. The number was only 1905 in March 2002. Thus the number of SHGs in the district increased by about 6.5 times in the period between 2002 and 2007. Though the share of credit disbursed in the district is 6.56 per cent of the total credit disbursed in West Bengal, the amount of loan received by the members of the SHG increased by about 12 times from Rs 12.96 million in 2002 to Rs. 159.08 million in 2006.

The SGSY is being implemented by District Rural Development Agencies (DRDAs) with the active involvement of Panchayats, Banks, the line departments and the NGOs. Under the SGSY, assistance is given to the poor families living below the poverty line in rural areas for taking up self-employment. The persons taking up self-employment are called *swarozgaris*. They may take up the activity either individually or in groups, called Self-Help Groups. For successful Self-Employment, it is

*Source: NABARD*
necessary to take up the right activity. For this purpose, 4 to 5 activities are selected in each Block with the help of officials, non-officials and the Bankers. These are called ‘Key Activities’, and should be such that they may give the Swarozgaris an income of Rs. 2000 per month, net of Bank loan repayment.

The SGSY scheme of self-employment is well in progress in the district of South 24 Parganas. From the data given by the DRDC, South 24 Parganas Zilla Parishad there is sector-wise classification of key activities. The sectors are primary sector, secondary sector and the tertiary sector. Within the primary sector the key activities are projects related to irrigation, livestock and others. The secondary sector comprises village industries, handicrafts, handlooms and other activities. Activities related to tailoring, shops, bullock-carts and others are found in the tertiary sector. Out of these mentioned activities some of the SGSY programmes in the blocks emphasize some specific activities. The primary sector activities are most common among the swarozgaris. Within the primary sector livestock related activities have been very popular in the blocks of Budge Budge-II, Canning-I, Gosaba, Thakurpukur-Mahestala, Diamond Harbour-I, Magrahat-I, Magrahat-II and Mathurapur I and II. Village industry is a key activity of swarozgaris in the blocks of Diamond Harbour-I, Magrahat-I, Magrahat-II and Namkhana. Handicrafts are very common in Magrahat-II. Tailoring is
popular in Thakurpukur-Mahestala, Diamond Harbour-I and Magrahat-II.

Effective self-employment not only means choosing the right activity but also carrying out the activity in the right manner. Self-employment involves procurement of raw materials, production, marketing of goods and dealing with finance. A single Swarozgari may not be able to do all this by himself/herself. It is, therefore, advisable for the Swarozgaris to form Groups – the Self-Help Groups. SGSY actively promotes Self-Help Groups. A Self-Help Group (SHG) may generally consist of 10-20 persons. Generally, all members of the Group should belong to families below the poverty line. However, if necessary, a maximum of 20%, and in exceptional cases, where essentially required, up to a maximum of 30% of the members in a Group may be from families marginally above the poverty line if they are

Box 4.3 : Uttar Jafarpur Mahila Machhchas Samabaya Samity - a success story

Uttar Jafarpur is a village in Falta where masonry brush making had been the main source of non-agricultural income in most of the households for a long time. In recent times the main occupation of the households has changed to culture of ornamental fish. The change has been gradual and successful. We take a glance backward to know how and why it happened.

Being inspired by other groups in the locality and of course, the representative of the Fisheries Department, 15 women proceeded to a society that would practice ornamental fish culture. They got registered with the Department of Fisheries as Uttar Jafarpur Machhchas Mahila Samabaya Samity Limited. Since then the success story of the society has attracted not only other women of the village but has also became a model to have been visited, praised and complemented by Honourable Members of Standing Committee of the State Legislative Assembly, the Commissioner of Fisheries of the Government of Tripura, Honourable Members of the IFAD team as also by many researchers from different research institutes including Delhi University. At present, there are 28 members in the society.

The society was assisted technically, financially as well as in kind by the government. All the members got training on ornamental fishery under RSVY scheme from the Fisheries Department. Six managing committee members of the society got Co-operative Management Training. The members were provided with the first dose of loan amounting to Rs. 67150 each, of which Rs. 40290 was loan and Rs. 26860 was the state government share. After repaying the entire amount of the first loan they received the second dose of assistance of Rs. 30,000 as well. The society also received requisites and inputs like oxygen cylinders, dry-food making tools, dry-food etc. worth Rs. 52,000.

The outcome of all these forms of assistance is worth mentioning. First of all, the financial condition of the member households was very poor initially. In the last three or four years, the income level of each of the member households has changed from around Rs. 1000 to Rs. 5000 per month. In fact, all the members have opened individual bank accounts in at the local State Bank. Some of the members could even get their lives insured with LIC. In general, the living standard of each member woman and member households of the society are being attracted and gradually getting engaged in supplying products of ornamental fish farms to different markets and agencies.
acceptable to BPL members of the Group. In order to involve rural women in the process, 50% of the SHGs are exclusively for women.

Financial Assistance under the SGSY to individual **swarojgaris** or Self-Help Groups is given in the form of subsidy by the Government and credit by the banks. Credit is the critical component of the SGSY, subsidy being a minor and enabling element. SGSY promotes multiple credit rather than one-time credit injection. Subsidy under the SGSY is uniform at 30 per cent of the project cost, subject to a maximum of Rs. 7500/-. In respect of SC/STs and disabled persons, however, these are 50 per cent and Rs. 10,000/- respectively. For groups of Swarojgaris (SHGs), the subsidy would be 50 per cent of the project cost subject to per capita subsidy of Rs. 10,000/- or Rs. 1.25 lakh whichever is less. There is no monetary limit on subsidy for Irrigation Projects. Subsidy is back ended. It is financed on 75:25 cost sharing basis between the Centre and the States.

About 5 per cent of the total SHGs formed in the State under SGSY till date since its inception belong to the district of South 24 Parganas. For the 11928 groups formed in the district till January 2008, credit has been disbursed to the amount of Rs134.192 million in addition to the subsidy component amounting to Rs. 93.038 million. Of the self-help groups formed in the district, about 57 per cent have been operative in the blocks of the Sundarbans. Maximum number of groups (1217) has been formed in Patharpratima against a minimum (63) in Thakurpurkur-Mahestala (Table 4.22). Such group formation is found to be comparatively lower in the blocks closer to urban centres. About 53 per cent of the groups formed in the district are groups formed by women.

Right from the beginning, it is necessary that the SHGs should be nurtured carefully. The objective is to identify the weaknesses, if any, and help the group to overcome the same through training and capacity building inputs, so as to develop into a good group. So it is necessary to subject each Self-Help Group to a test to assess whether it has evolved into a good group and is ready to go into the next stage of evolution. This is done through a grading exercise carried out at different stages.

The formation stage lasts for about six months or more depending upon the literacy, awareness levels, socio-economic background of the people being organised, as well as the capacity of the facilitator involved in the process of social mobilization and Group formation. At the end of the formation stage the groups are subjected to first grading immediately.
Indicators of evaluation considered for Grade I include regularity of meetings and attendance rate of the members in the meeting, transparency of rules of the group, regularity of savings and the share of savings forwarded as loan, repayment rate, maintenance of accounts, involvement in social activities, and presence in the meetings of assistants. A group scoring 60% in the evaluation process passes grade I. At this stage the group can open cash-credit account to the limit of four times the group corpus in the concerned bank. Also DRDC provides them with revolving fund of Rs. 5000. Small productive investments can be made by the group with credit obtained at this stage. Six months after the first evaluation, the group is liable to the second stage of evaluation called Grade II. For grade II, in addition to evaluation of indicators for Grade I, it is seen whether revolving fund has been rightly utilised, loan and repayment of loan is satisfactory or not, whether full knowledge has been obtained about the project and transactions with the bank. Groups scoring 80% or more pass Grade II and enters the third stage, wherein it receives credit from the bank as well as additional Revolving Fund to undertake major investment projects.

About 66 per cent of the groups in this district have passed Grade I. So 7876 number of groups were availing small credit while 14 per cent passing Grade II could avail credit for major investment in production rather than consumption. However, only 9 per cent of the groups passing Grade I and 3 per cent of the groups passing Grade II have taken up economic activities. Though larger number of groups have been formed in the Sundarbans but in terms of taking up economic activities, Region II has been far more efficient. In fact 85 per cent and 47 per cent of the groups taking up economic activities after passing Grade I and Grade II respectively are from Region II. So, there is further scope of overcoming the problems of weak groups so that they can take up more and more economic activities successfully.

b. National Rural Employment Guarantee Act, 2005

NREGA, 2005 is an Act to provide for the enhancement of livelihood security of the households in rural areas of the country by providing at least one hundred days of guaranteed wage employment in every financial year to every household whose adult members volunteer to do unskilled manual work and for matters connected therewith or incidental thereto. Unlike any other government scheme, it gives a legal guarantee of wage employment. Every person who has done the work given to him under the Scheme is entitled to receive

Source: NREGA Cell, South 24 Parganas
Taramoni Das of Bibir Chowk village is an illiterate middle-aged woman who lives with her husband, two children and mother-in-law. Bibir Chowk is a village in Langalberia Gram Panchayat of Sonarpur Block. Taramoni’s husband is illiterate and works as a daily casual labour who doesn’t have any year-round employment. Both the children go to school – the boy studies in Class VII and the girl in Class III in local government schools. Taramoni wants her children to get proper education. Fluctuation in her family income due to the casual nature of employment for her husband compels Taramoni to look for supplemental income to ensure her children’s education. Without any specialized skill, the only opportunity for Taramoni is to work as a daily labourer in the guava orchards of the locality at wage as low as Rs. 50 per day. But, even this opportunity is seasonal and comes only when the guava crop is harvested.

When we met Taramoni on January 30, 2008, she was working along with her mother-in-law Gouri Devi and 300 others in a project taken up jointly by the Gram Panchayat and Panchayat Samiti under National Rural Employment Guarantee Scheme. A pond on nine bighas of vested land, locally known as Hedupukur, was being dug and renovated by 300 workers – all of whom were poor residents of the area. Forty per cent of the labourers were women. Both men and women worked at a daily wage of Rs. 75. Each male labourer was supposed to dig and clear 88 cubic feet of mud and soil daily to earn his wage while each female worker was made responsible for clearing 75 cubic feet of soil. When we turned up at Hedupukur, the elected Gram Panchayat members were present at the site and inspecting the work. A conversation with one of them revealed that the Panchayat was planning for beautification of the pond and the surrounding area. A sweet-water fishery organized on co-operative basis by the local Self-Help Groups for income generation was one of the objectives behind the project. In an adjacent plot which is also vested, the Panchayat planned to develop a picnic spot with all the necessary facilities for renting out. This, the Panchayat members hoped, would somewhat enhance the GP’s own revenue collection.

When we asked Taramoni whether she would be talking to us for a minute, she came up from the pond being covered in mud. She was toiling hard and earning little, but her face revealed that she was happy with her work. She expected to continue with the work for at least thirty days. The Panchayat member seconded this by stating that Rs. 10 lakh had already been sanctioned for the project most of which would be spent in labour payment. The Gram Panchayat was trying to get more funds from the upper tiers. Taramoni said that winter is a lean season for guava crop and it was very hard to find other work. So it was very good that the Panchayat took the initiative for the project which provided many like her the opportunity to earn some money for the family. She hoped for more initiatives like this in future. Her peers - among whom there was her mother-in-law, Gouri Devi-called her back to work and she joined them carrying her jhora (a bamboo basket). They started carrying loads of soil on a relay basis while laughing and joking among themselves. It was indeed a happy sight that NREGS - a Government programme – was bringing smiles to poor women like Taramoni.

wages at the wage rate for each day of work on a weekly basis or in any case not later than a fortnight after the date on which such work is done. The Panchayats at district, intermediate and village levels are the principal authorities for planning and implementation of the Schemes made under this Act. Any adult living in rural areas can apply for work. That is, the benefits of the Act are not restricted to households living below the poverty line.

The two steps followed to apply for work are: first, a household has to register with the gram panchayat. Then the adult members of the household have to apply for work. While registration of the household must be done only once every five years, individual applications for work have to be submitted each time work is sought. After registration of the household, a job card is issued to the household. This card records details of the number of days a person has
worked, wages received, unemployment allowances received, and so on. Applications for work are submitted to the applicant’s gram panchayat or the state employment guarantee scheme’s block-level programme officer. If an applicant for employment under the Scheme is not provided with such employment within fifteen days of receipt of his / her application seeking employment or from the date on which the employment has been sought in the case of an advance application, whichever is later, he is entitled to a daily unemployment allowance.

So far as the district of South 24 Parganas is concerned, much is yet to be achieved in terms of employment generation under this Act in this district. Only 2.6 lakhs of households in the district have demanded employment in a period of ten months between April 2007 and January 2008, whereas according to RHS 2005, there were about 4.2 lakhs households below poverty line in the district. Though NREGA is not meant for BPL households only but the number of households that are demanding such employment is not even equal to the number of BPL households in the district. Demand for employment and creation of employment through NREGA has been much higher in Region III compared to Region I or II. Per household employment generated in Region III has been 15.05 mandays in the given period as compared to 10.44 mandays in Region I or 10.39 mandays in Region II.

A possible explanation for comparatively lower demand for employment under NREGA seems to be the fact that a minimum wage of Rs. 75 per manday would mean average yearly income of Rs. 7500 per household which is Rs. 625 per month per household at present minimum wage is Rs. 81 per manday. Such income can only be the supplement of the household income from some other form of stable income. It is instead natural for the household members to move in search of some form of regular income and smooth out the risk rather than wait and demand for such irregular type of employment. Perhaps that is the reason that only about one-third of the households registering their application have finally demanded such employment. Households from blocks of the Sundarbans have actually opted more for such employment due to the absence of other type of employment. Almost hundred per cent of the households demanding such employment have been provided with work though it was far below the targeted level of hundred mandays. This is where government intervention is strongly required so that the possibility of employment generation under this Act be fully exhausted.
4.6 Concluding Comments

The livelihood patterns in an area often depend on its prevailing economic, social and geographic characteristics. The district of South 24 Parganas is no exception and, due to the wide variation in topography of the district, the employment opportunities are different in different regions. Only 16 per cent of the district population resides in the urban areas. Among the rest, a large section, particularly in thirteen of the twenty nine blocks of the Sundarbans, lives in the riverine villages. While the blocks close to Kolkata metropolis have greater dependence on non-farm employment, dependence on agriculture and allied activities increases as one move farther south.

Agriculture in the district is turning out to be gradually unremunerative, high dependence on which is often leading to poverty. As a result, decline in the agricultural workforce is observed in the district. This in no way means that the potential of agriculture is exhausted in the district. There are constraints in agriculture which can be overcome in the future. Emphasis needs to be given particularly on making irrigation facilities available. In the absence of any such initiative to improve the return from agriculture, people are shifting towards other means of income in the non-agricultural sector. So a process of structural transformation is taking place in the district. However, it is indeed a matter of concern that this process is mostly towards a vulnerable low return non-agricultural sector. This together with the crisis in returns to agriculture poses serious challenge to the development process of the district. Of course, besides improving the condition of agriculture, there are other areas of prospect and potential which need to be tapped immediately.

The importance of better communication network between the rural areas and the urban centers in promoting rural employment has also been revealed by our study. The existence of such a network can, on the one hand, allow ‘temporary migration’ between the rural and urban areas and, on the other, can lead to better marketing channels of the rural products. We also found the successful existence of sub-contracting in the areas that were in the urban proximity. Such vertical integration of industries can be emphasized further only when the transport and communication network between the villages and the closest industrial centers are good enough.

Among alternative sources of employment and livelihood, pisciculture is an area which already employs a large number of people, but large unutilized capacity still remains. Horticulture is another area that can be developed into a very remunerative employment generating activity with proper infrastructure development. The Sundarbans being a World Heritage Site, there is a lot of interest and if proper facilities are developed in an eco-friendly manner, tourism industry with have a huge potential in the district.
Chapter 5

Literacy and Education in the District

5.1 Introduction

Education is a human right. Education is essential for human emancipation and social development. It contributes to better health, higher productivity, greater income, human freedom, capability and esteemed living, increased participation in community life. Education is the single best development investment and a powerful instrument to develop an economically prosperous society. The long term social and economic return from education is enormous.

Education, as articulated in National Policy on Education (1986), is a “dynamic, cumulative, life long process providing diversity of learning opportunities to all segments of society.” The Human Development Reports (HDR) published by United Nations Development Programme (UNDP) stress upon the importance of education in human development. The basic underpinning behind the concept of human development is that the income centered understanding of human development cannot manifest the actual development scenario and needs to be attended by other aspects such as education. The Human Development Index (HDI) uses literacy rate and school enrolment rate to develop an index of education. The literacy rate is given a two-third and school enrolment rate a one-third weightage in formulating the index.

5.2 Education Scenario in South 24 Parganas vis-à-vis Other Districts of West Bengal: A Consistent Mediocrity

The literacy rate in South 24 Parganas as per Census 2001 is higher than the literacy rate of West Bengal. The literacy rate in the district fell short of the state literacy rate in 1991. But an impressive decadal movement during 1991-2001 has raised the literacy rate in South 24 Parganas to be higher than that of West Bengal.

The Human Development Reports (HDR) published by the United Nations Development Programme (UNDP) stress upon the importance of education in human development. The basic underpinning behind the concept of human development is that the income centered understanding of human development cannot manifest the actual development scenario and needs to be attended by other aspects such as education. The Human Development Index (HDI) uses literacy rate and school enrolment rate to develop an index of education. The literacy rate is given a two-third and school enrolment rate a one-third weightage in formulating the index.

N: North, S: South, N.A.: Not Available
* Census 2001; **Derived from Central Sample data of the NSS for the 55th Round (1999-2000)
Ranks are calculated for a list of 17 districts of West Bengal. The highest in each case except gender gap is ranked 1. The lowest is ranked 1 in case of gender gap.
rate of South 24 Parganas above the state level in 2001. The most satisfactory development was in female literacy rate. Whereas female literacy rate in 1991 was far below the state average, an almost 20 percent point rise in female literacy rate in the district has pushed it near the state average in 2001. The decadal percentage point increase in male and female literacy rate in the district was higher than the increase in male and female literacy rate registered in the state during the same period. The district recorded a higher decadal percentage point increase in literacy from 55.10 per cent in 1991 to 70.16 per cent in 2001. The state literacy level increased from 57.7 per cent in 1991 to 69.2 per cent in 2001. The district observed a note-worthy decrease in gender gap in literacy during the decade.

The West Bengal Human Development Report (2004), following the UNDP HDR, used literacy and school enrolment rate as parameters of education to formulate education index for West Bengal. The performance of the district is near the average when compared to other districts of West Bengal. The district was ranked 8th in terms of overall human development index. The district also stood 8th in respect of both the parameters of education i.e. the literacy rate and the school enrolment rate. Though the comparative position is not favourable, a ray of hope is seen, when the decadal performance of the district is analysed. A comparative study among 18 districts of West Bengal reveals that the decadal percentage point improvement in female literacy in South 24 Parganas ranks 4th highest. The change in overall literacy during the decade is also worth mentioning and is 5th highest amongst the districts of West Bengal.

The West Bengal Human Development Report (2004) found two aspects of education that needs careful policy intervention in the district. Both for literacy and enrolment, the gender gap measured by male female difference, is alarmingly high in the district. It is observed that gender disparity for these two parameters is wider.

Ranks are calculated for a list of 18 districts of West Bengal. The highest is ranked 1.
when compared to many other districts of West Bengal. Another alarming observation is the low rate of literacy among the underprivileged classes specially the STs. The district is outperformed on the said two fronts by the contiguous districts e.g. Kolkata, Howrah, North 24 Parganas and Medinipur.

5.3 The State of Elementary Education: An Inter Regional Comparison

Literacy and basic schooling liberate people. They impart skills and confidence and change the lifestyle of learners. They are instrumental in reducing sense of insecurity carried by an illiterate person. Elementary education can be very important to get gainful employment. Literate people are more vocal and are more capable of invoking their rights. Basic education for women is vital as it has a multiplier effect on social development. Women’s education influences women’s ability to earn independently, to find employment outside the home, and, to gain decision making power within and outside family. Women’s literacy and elementary education control fertility rate, mortality rate of children, gender disparity within the family. Educated women marry later and are more likely to send their own children to schools.

It is obvious that any district level development initiative is directed by the policies taken at the state level. The state of West Bengal has long been spending a sizeable proportion of the budget on education. The central programmes on literacy and elementary education are earnestly implemented. The literacy movement has also been taken as a political movement in the state. Though there are variations across districts, this has led to increase in literacy at a rapid rate and the district of South 24 Parganas has really proved it.

5.3.1. Literacy

The most authentic estimates of block and municipality level literacy are obtained from the Census reports. The latest Census report (2001) found the literacy rate in the district to be 70.16 percent. The male literacy rate of 79.89 percent, is predictably higher than the female literacy rate, which is 59.73 percent. The most spectacular improvement in literacy during 1991-2001
was observed in respect of rural females (Figure 5.1). An analysis of the decadal growth (1991-2001) of literacy rate reveals that 21 among 29 blocks and 1 among 7 municipalities registered more than 15 percentage point increase in literacy rate (Table 5.4). Municipalities generally are far ahead than blocks in terms of literacy rate indicative of a substantial rural urban gap. Surprisingly, decadal performance in some municipal areas is not worth mentioning. Whereas Rajpur Sonarpur municipality registered only 1.63 percentage point increase during 1991-2001, literacy rate in Maheshtala municipality actually went downward. The administrative reorganisation of the municipality might be the cause of fall in literacy. No remarkable change in the relative position of the municipalities has been seen during 1991 and 2001. Whereas Baruipur, Rajpur-Sonarpur and Maheshtala municipalities were the forerunners in 1991, only Baruipur and Rajpur-Sonarpur retained their positions in 2001. The best percentage point increase of 21.74 percent in literacy rate among municipalities was achieved by Pujali municipality. But the achievement was not enough to raise the relative position of the municipality. Pujali, among municipalities of the district, remained at the bottom in 1991 as well as in 2001.

So far as the blocks of the district are concerned, the blocks of the Sunderban region excepting Sagar and Namkhana are the worst performers in terms of literacy. The situation has not changed much during the decade of 1991–2001. All 5 worst performing blocks, in 1991 and 2001, were in the Sunderban region. Though literacy performance in blocks of Sunderban is poor, all blocks of Sunderban other than Sagar and Mathurapur-I registered a 15

Ranks are calculated for a list of 29 blocks and 7 municipalities of the district of South 24 Parganas. The highest in each case except gender gap is ranked 1. The lowest is ranked 1 in case of gender gap.
Figure 5.2: Changes in Literacy Rate in South 24 Parganas: 1991–2001
percentage point increase in literacy during 1991-2001. Sagar and Namkhana were among the best five performing blocks amongst all blocks of the district as per both 1991 and 2001 census estimates. The two blocks ranked poorest in terms of standard of living are also positioned as worst two performers by literacy in 2001. These two blocks, Canning-II and Basanti, were the worst two performers by literacy in 1991 too. The Region of South 24 Parganas that surrounds the district of Kolkata, the district having the highest literacy rate in West Bengal, span between moderate to good performers. No block or municipality in this region of South 24 Parganas is in the list of the last 15 in terms of literacy rate. One notable observation is that the blocks in the district are quietly catching up with municipalities in literacy achievement. Whereas there were no blocks in the best 5 performers list in 1991, Namkhana entered the list of best 5 in 2001 when all blocks and municipalities are considered together. Migration of a large section of people from the district of Medinipur to the blocks of Sagar and Namkhana and their positive attitude towards education may well be a reason for higher literacy rate in these areas.

Figure 5.3: Literacy Rate (2001) in Blocks and Municipalities: Toppers and Backbenchers
Educationally Backward Blocks

Which?
- Canning-II, Basanti, Joynagar-II and Kultali.

Where?
- Sunderban.

Why?
- Rural female literacy rate as per census estimate of 2001 is at most 46.21 per cent.
- Gender gap in literacy as per census estimate of 2001 is at least 24.08 per cent.

Not only in terms of rise in literacy rate, the district made considerable achievement in reducing inter-block/municipality variation in literacy rate. The difference in the maximum and minimum literacy rates achieved by different blocks and municipalities, represented by range of the estimates, fell from 51.01 in 1991 to 38.89 in 2001. The coefficient of variation, indicating the extent to which literacy rates in blocks and municipalities vary among themselves, fell from 21.32% in 1991 to 11.21% in 2001. This implies that areas having low literacy rate had been catching up with the areas having high literacy during 1991-2001.

5.3.2 Enrolment and Drop Out

Literacy improves enrolment. Literate parents are expected to send their children for primary schooling. Primary schooling is almost free in the state and there has been improvement in support services for students such as free textbooks, uniforms, mid-day meal, health care facilities, etc. This has led to a substantial improvement in enrolment at the primary level. Enrolment data are often over-reported. There is also a chance that a particular student has enrolled in more than one institution. However, the achievement of the district in enrolling children cannot be disowned even though the data may be somewhat unreliable.

An indicator of enrolment at the primary level is the proportion of 5 to 8 age group children enrolled in schools. The enrolment of the age group increased from 91.91 percent in 2000-01 to 98.21 percent in 2006-07 (Table 5.5). Predictably enrolment rate for 9 to 14 age group children is lower.

Source: Office of the District Project Officer, Sarva Siksha Abhiyan

than the enrolment rate for the 5 to 8 age group children. The performance of the district in enrolment of 9 to 14 age group children is also very promising. The estimate as per records of 2006-07 is 93.83 percent. Every block and
municipality in the district has an enrolment rate above 95 percent in respect of 5 to 8 age group children and above 85 percent in case of 9 to 14 age group children as per the estimates obtained in 2006-07. The inter-block/municipality variation in enrolment is smaller when compared to inter-block/municipality variation between literacy rate. The difference in the maximum and minimum enrolment rate, for 5 to 8 age group children and for 9 to 14 age group children are respectively 4.79% and 12.45% in 2006-07. The coefficient of variation of enrolment rates, representing variability within blocks and municipalities, for the

Figure 5.5: Enrolment Rates of Children in Blocks and Municipalities of the District (2006-07)

---

**Figure 5.6: Enrolment Rates of 5-8 Age Group Children (2000-01) in Blocks and Municipalities: Toppers and Backbenchers**

---

1. Enrolment 5-8 Age Group Children
2. Enrolment 9-14 Age Group Children
two age groups are respectively 1.46% and 3.45%. The coefficient of variation for 5 to 8 age group children enrolment fell from 11.79% in 2000-01 to 1.46% in 2006-07. Thus, like literacy, areas lagging behind on enrolment are catching up with their counterparts placed ahead. The correlation between literacy and enrolment is observed in the district. The rank correlation coefficient between literacy rate and enrolment rate of 9-14 age group children is 0.71. The result indicates that literate people are more aware about the importance of education. They do not like to withdraw their children from the system of education at upper primary level.

Enrolment of children in higher income areas might be more than that in lower income areas. The blocks of Sunderbans in South 24 Parganas have a long history of backwardness. Interestingly these blocks do not exhibit lagging behind when enrolment rates are analysed. The best 3 blocks in terms of 5 to 8 age group enrolment in 2000-01 were in the Sundarban region. Namkhana, one block in the Sunderban region, has the highest enrolment rate in 5 to 8 age group according the latest available estimate of 2006-07. The block maintains the impressive performance for enrolment of 9 to 14 age group children also.

Figure 5.7: Social Group-wise Students Enrolment in Schools (2007–08)

The social group wise analysis of enrolment in primary and upper primary schools shows that a sizeable proportion of children from backward groups enroll themselves in schools. Proportion of students coming from SC, ST and OBC community more or less remains same at primary and upper primary level. While 36.15 percent of students from SC, ST and OBC community get enrolled at primary level, enrolment of students from these communities marginally increases to 39.19 percent at upper primary level.

But all those enrolled children do not

Source: Office of the District Project officer, Sarva Siksha Abhiyan
CRF %: Percentage of students completing the course in 4 years
DROP %: Percentage of students dropping out
REP %: Percentage of students who repeated
MIG %: Percentage of students who migrated

Ranks are calculated for a list of 29 blocks and 7 municipalities of the district of South 24 Parganas.
The highest in CRF % is ranked 1. The lowest is ranked 1 in case of DROP %.
The problem of drop out is severe at every stage of education. Students drop out for several reasons. Drop out is caused by unfavourable education infrastructure, non-adaptability to the teaching learning process and consequent alienation from the education system, detention in the same class and more importantly pressure to join work force as a child labour. A more reliable analysis about the dropouts could have been made if data regarding the social, economic and religious composition of the dropped students were available. The block/municipality wise cohort study (Table 5.6) throws some light on dropouts in different blocks and municipalities of South 24 Parganas. A Cohort study analyses performance of same student in consecutive academic years to investigate whether the student drops out or repeats or promotes to the next class successfully every year. The reported figures for primary schools are based on 202284 students of 3321 schools of the district. A similar cohort study was carried on 97061 upper primary students of 751 upper primary schools. These studies show that drop out is a critical problem at both the primary and upper primary stage. The drop out rate increases with higher stages of education. A higher percentage of students withdraw from the upper primary level.

Figure 5.8: Drop-out Rates in Primary and Upper Primary Schools (2004–05)
Drop out rates at the primary level are low in municipal areas such as Pujali, Baruipur and Budge Budge. Drop out rates at Rajpur Sonarpur and Diamond Harbour municipality falls at the upper primary level, though marginally, when compared to primary level. A significant rise in drop out rate, from primary to upper primary, is observed in municipal areas of Maheshtala and Budge Budge. These are the areas where industries employ child labourers. Drop out rate is more than thrice at the upper primary stage at Pujali and Joynagar Mazilpur municipality in comparison with drop out rate at the primary level.

Careful examinations of drop out rates in different blocks reveal a miserable education scenario. Drop out rate at the upper primary level is higher for every block except Magrahat-I and in many cases the drop out rate is more than double of the rate of drop out at the primary stage. The scenario is deplorable in blocks of Sunderban. Canning-II, an educationally backward block, has a drop out rate above 50 percent in the upper primary level. Drop out rates in other educationally backward blocks are also alarmingly high (Figure 5.8). A good performer on literacy, Sagar, has performed well in reducing drop out rate at the primary level. This may be a sign of positive attitude towards education shown by literate parents. Good performers in terms of standard of living such as Thakurpukur Maheshtala and Budge Budge-I are success-
ful in reducing drop out rates at primary level. Among blocks, Bhangar-I has shown commendable performance in controlling dropouts at the primary stage but the success dwindles out when data regarding drop out at the upper primary stage is compared with data at the primary stage.

Why do students drop out? There may be several causes as stated earlier behind drop out but the most important cause might be the use of child labour or use of children as domestic help. It is unfortunate that poor parents often are compelled to treat their child as an income earning asset. They induce children to leave schools and join the workforce and thus earn income for the household. Students studying at the primary level are not generally capable to join the labour force. But as age increases, a child becomes a child labour and drops out from the education system. This is one of the important determining factors behind higher drop out rates at the upper primary level. A moderate rank correlation coefficient of 0.44 between incidence of and rate of drop out at the upper primary stage, when only blocks are considered, imply that students drop out more in areas where the incidence of poverty is high. The relationship between incidence of poverty and rate of dropout at the primary stage is not so strong. This indicates that poor parents withdraw children of 9-14 age group more than children of 5-8 age group.

The Rural Household Survey (2004-05) surveyed households that have a dropped out child in the 9 to 14 age group. The obtained results (Table 5.7) clearly indicates that a high proportion of the dropped out students worked either inside or outside the household. An inference can be readily drawn that the pressure to take up work has forced them to drop out from the system of education. The tendency to leave schools and to join the workforce is more severe in backward regions. A regional-wise study of dropouts reveal that the north west blocks of South 24 Parganas, closer to Kolkata, are less vulnerable to the problem. Bhangar-I, the block for which dropout rate increases dramatically at the upper primary stage when compared to the primary level, has almost 80 percent of dropped out children working inside or outside the family. The tendency to leave schools and join work force is most severe in the blocks of Sunderban. More than 90 percent of students dropping out work either inside or outside the household in Kakdwip block.

It has been already stated that literacy improves enrolment of 9-14 age group children in the district. Literacy has also a positive impact on controlling drop out. A literate mother is more conscious about the education needed by her child. She is more sincere about enrolling her children in the education system. The rank correlation coefficient between female literacy rate and drop out rate at the primary

Source: Rural Household Survey (2004-05)

Ranks are calculated for a list of 29 blocks of the district of South 24 Parganas. The lowest is ranked 1.

Level, when all blocks and municipalities are considered together, is 0.62. The same coefficient when female literacy rate and drop out rate at upper primary level is considered is 0.59. This suggests that more effort to improve female literacy will be helpful in controlling drop out at the primary and upper primary stage.
5.3.3 Gender (Dis)parity: A Missing Woman Syndrome

The well-known Millennium Development Goal calls for targeting universal primary education and to reduce gender gap at all levels of education. Women’s education promotes equal participation across genders in the decision making process, supports women so that they can exercise their right, reduce the gap between women’s and men’s access and control of resources and benefits of development. An analysis of any indicator for educational achievement shows that historically women are less privileged than men.

The literacy figures for the blocks and municipalities of South 24 Parganas show that women are lying far behind men. Five blocks namely Canning-I, Canning-II, Basanti, Kultali and Joynagar-II are blocks where female literacy is less than 50 percent. These blocks are in need of gender targeted policies to enhance female literacy rate. Blocks performing well in male literacy are generally good performers of female literacy also. Namkhana and Sagar, though in the Sunderban region, perform well in male as well as female literacy.

Predictably female literacy is higher in urban areas. Kultali, Bhangar-I and Bhangar-II are blocks that have achieved a high percentage point increase in female literacy during 1991-2001. Though the present situation calls for further intervention, a sincere effort has led to reduction in gender gap during 1991-2001. Whereas there were 16 blocks having a gender gap of literacy above 30 percent in 1991, there is no block with the same exceeding 30 percent in 2001. A regionwise comparison of female literacy reveals that the spirit of educational development in Kolkata may have been transmitted to its contiguous regions. Blocks in this region such as Thakurpukur Maheshtala, Budge Budge-I and Bishnupur-II are the best performers in female literacy.

Female Education: Some Individual Experiences

Subhadra Sarkar passed class VIII and was then forced to get married. She was living with her family in a remote village named Bharatgarh in Sunderban region. She was eager but was not able to continue her studies due to financial constraints and family obligations. She was inspired to resume her studies. She took admission in class IX in Maheshpur Prafulla Balika Vidyalay in 2002-03 session after some years of her married life. She was provided with all kinds of necessary support in the school and passed madhyamik examination in 2004-05 with high second division marks. She went on continuing her studies and passed higher secondary examination from the same school.

Tripti Tarafdar of Nafarganj lost her parents at an early age of her life. She continued her studies up to class VIII fighting against dire poverty and later went to Delhi in search of jobs and was absorbed as a housekeeper there. She worked for more than two years, saved some money and came back. She took admission in a school in the district. She started living in the school hostel, studied assiduously and stood first in all the unit tests held in the class. She is expected to perform well in the annual examination also.

Performance of blocks and municipalities is more dispersed in case of female literacy when compared with male literacy. The coefficient of variation for female literacy (16.87%) is more than double of that for male literacy (7.65%) in 2001. The difference in female literacy rate of the highest achiever i.e. Baruipur municipality and the worst performer i.e. Canning-II is alarmingly high at 49.10%.

The corresponding estimate in case of male literacy is only 29.23. But the situation is fast improving. The coefficient of variation for female literacy rate, which was 36.56% in 1991, fell sharply to the present level during a span of 10 years. Similarly the difference in achievement of the best and the worst performer fell from 59.78% in 1991 to 49.10% in 2001. Female literacy rate is poor in income
poor areas. The rank correlation coefficient between female literacy and poverty rate, when only blocks are considered, is 0.45 implying that female literacy falls as rate of poverty rises. Income constraints female education more stiffly than male education.

A completely different scenario is observed in case of school enrolment of 5 to 8 age group children. The 2000-01 estimate of enrolment shows that many blocks and municipalities are better performers in female enrolment than male enrolment. In blocks where female enrolment is less than male enrolment, the difference in the two enrolment rates is marginal. Such a good performance in female enrolment indicates that female literacy rate is going to rise in near future. Though the age distribution of the non-literate is not available, poor performance in female literacy may be due to higher incidence of illiteracy in the adult age group.

A social group wise breakup of girls’ enrolment at primary and upper primary levels indicates that the district has achieved distinctively in enrolling students of backward classes. Enrolment of SC, ST and OBC girls as a proportion of total girls’ enrolment at the primary level is 35.47 percent. The same proportion at the upper primary level is 36.72 percent. Girls’ enrolment as a proportion of total students’ enrolment of that social group shows that backward group girls are taking the opportunity of education as after as backward class boys.

Though female enrolment at the elementary stage of education is quite impressive, the enrolment figures at higher stages reduce sizeably. The impressive performance more or less continues upto the madhyamik level. The female enrolment in high school level according 2004-05 estimate is even higher than the male enrolment. At a higher level, female enrolment falls drastically. This may be due to parental unwillingness to support studies of the girl child at a higher level. There are cases when a parent supports education of the male child but withdraws the girl child. The financial requirement needed at a higher level of study often discourages parents to support their girl child. Another important factor behind this falling female enrolment can be attributed to early age of marriage of girl child. The sudden drop of female enrolment at the higher secondary level indicates early marriage of girl child reducing female enrolment. Drop out between high school and higher secondary school stage requires proper scrutiny since drop out between higher secondary and college stage is interestingly minimal. Female enrolment in professional and technical institutions
Sex ratio is also very low. Female enrolment was around 25 percent of total enrolment in both technical schools and colleges in 2004-05. Thus females getting into education stream do not reach up the top of the ladder as males do. Girl students miss the privilege of higher education and they silently vanish from the system.

### 5.4 Education Infrastructure

Provision and accessibility to school level infrastructure is important in educational development. If school infrastructure is not widespread and well distributed across
regions, students have to lose time in commuting and may have to incur additional monetary costs for commuting. This often discourages them to join or continue schooling. Apart from the number of schools, the structure of the schools, availability of basic amenities such as drinking water and sanitation in school premises are also parts of educational infrastructure.

### 5.4.1 Development of Primary School Level Infrastructure

There has been reasonable increase in number of primary schools in South 24 Parganas in recent years. Whereas there were 3524 primary schools in the district in 2000-01, the number increased to 3656 by 2006-07. The accessibility aspect to primary schools can be assessed from the average population served by a school. The average population served by a primary school in municipalities is higher than that for blocks. As municipal areas are more densely populated, setting up of more schools is necessary in these areas. The average population served by a primary school is lowest in the blocks of Sunderban. One primary school, on an average, serves the need of more than 1700 population approximately in this region. Apart from the average population served, average area served by a school speaks for the accessibility scenario. It is recommended that every primary school going child should get the opportunity of attending a school within 1 kilometer radius from her residence. Lower distance implies lower time loss and lower commuting cost. While average population served by schools in municipalities is high due to congested urban settlements, the average area served is always below 1 square kilometer. The situation reverses in blocks. Though the average area served has fallen during 2001-2007 with increase in number of schools, it is well above the targeted limit in most of the blocks. Scenario in this aspect in the blocks of Sunderban such as Basanti, Canning-II, Kultali and Namkhana is bleak and provision of more schools is necessary. A more interesting observation is that Basanti, Canning-II and Kultali are notable poor performers in literacy. The weak

![Figure 5.12: Distribution of Primary Schools Across Regions](image)
performance in literacy may be partly due to inaccessibility to primary school infrastructure.

Provision of two amenities, water and sanitation, are basic necessities in a school. If pure drinking water is not provided in the school premises, then either the children have to bring water with them or they have to use nearby water source which may not be safe. Many children carry water in urban areas. This overloads the bag the children carry. But children in rural areas are not generally habituated with bringing water and hence resort to nearby sources. This results in health hazards caused by waterborne diseases and sizeable expenditure on treatment of diseases like diarrhoea. Sanitation facility is also a must in a school. Proper sanitation facility reduces the chance of outbreak of some diseases which may affect children seriously. Lack of sanitation facility is a major problem for girl children and there may be cases when a girl child would be unwilling to join or continue a school without having sanitation facility. There is considerable increase in provision of drinking water and sanitation facility in schools during 2001-2007. But around 20 percent and 30 percent of primary schools in the district are not provided with water and sanitation facility respectively. The provision of water and sanitation facility is best in the schools of Region-I. The situation is worse for Region–II and worst for Region-III.

As far as the basic infrastructures are concerned, the shortage of space is the most crucial infrastructural bottleneck in primary schools of the district. The standard indicator of insufficient space is the space student ratio below 7 square feet. The level of congestion in such classrooms may even hamper the teaching learning process. Though there is considerable addition of infrastructure during 2001-2007, the proportion of schools where the space student ratio is below 7 square feet is still alarmingly high and at around 60 percent. As in water and sanitation facilities in schools, the space shortage problem deteriorates from Region-I to Region-III. The high proportion of schools not having the required space student ratio in the southern region demands fresh fund flow. The shortage of space has far reaching adverse impacts on quality of education which will be discussed later.

Source: Office of the District Project Officer, Sarva Siksha Abhiyan
* As per number of schools in 2000-01 and population in 2001
5.4.2 Secondary and Higher Secondary School Level Infrastructure: The Quantity Aspect

The network of primary schools in the district is vast and widespread, but the number of schools at a higher level is insufficient. The ratio between number of primary schools and number of secondary and higher secondary schools in the district is 4.62:1 implying that one secondary higher secondary school is fed by more than 4 primary schools. Secondary and higher secondary schools, on an average, serve a larger population than a primary school in every block and municipality. Similarly, on an average, the area served by each secondary and higher secondary school is larger than the area served by a primary school. The scenario is not unexpected but the point of concern is the increase in number of population or area served by a secondary and higher secondary school compared to a primary school unit. This implies that students incur huge loss in terms of commuting time and traveling cost for attending classes while studying at a secondary and higher secondary school. This may result in irregular
attendance and drop out from the institution ultimately. Thus there is need to extend the network of secondary and higher secondary schools in the district.

The population served per secondary and higher secondary school is quite high and in the range of 10000-15000 in many blocks and reaches maximum in the block of Canning-II. The typical secondary and higher secondary school in the block of Canning-II serves a population of around 20000. The inaccessibility can be an important determining factor behind poor educational attainment in the block. Whereas, area served by most of the primary schools is in the range of 1-3 square kilometer, area served by secondary and higher secondary schools in many blocks ranges above 10 square kilometer. Average area served per school is above 20 square kilometers in Kultali and Canning-II. Students in almost all blocks of the Sunderbans face severe accessibility problem. The average area served per school is above 10 square kilometer in this region. The inaccessibility to high school institutions may even discourage parents to send their children in primary schools (Table 5.12).

The district has made considerable achievement in provision of basic amenities like drinking water and sanitation facility in secondary and higher secondary schools. The non-coverage is below 10 percent of total secondary and higher secondary schools. The performance is impressive when compared to the provision of drinking water and sanitation facility in primary schools. The percentage of non-coverage across regions is more or less similar. The proportion of schools not having drinking water facility is more than the proportion of schools not having sanitation facility in every region. The performance is relatively poor in region-II in both fronts. Special attention needs to be given to improve the coverage of schools within the net of safe drinking water supply in this region.

5.4.3 College and Professional Education

Inaccessibility to higher education is an often cited cause behind non-enrolment and drop out from the higher education system. Average square kilometer area served by a college level institution is more than that served by a lower level institution. This is common for any district of West Bengal and not an exception in case of South 24 Parganas. A wholehearted effort has increased the number of degree colleges from 22 in 2000-01 to 28 in 2004-05. There are 10 open university centers operating in the district along with these degree colleges. In recent times there is a huge demand for technical institutions. The district has responded accordingly and

</table>

a number of technical schools and colleges have been set up. Whereas there were 4 and 1 technical schools and college respectively in 2000-01 in the district, the number increased to 17 and 8 respectively by 2004-05. But the real problem is the distribution of the institutions across regions. A region-wise analysis indicates that most of the degree colleges and technical colleges are situated in the outskirts of Kolkata. Nine degree colleges are actually situated in the Kolkata Municipal Corporation area. There are 16 blocks in the district where there is no degree college at all. Many students residing in nearby blocks and municipalities of Kolkata take the opportunity of studying in premier institutions in Kolkata. But higher education aspirants in other regions not only face the accessibility problem but also miss the opportunity of studying in a quality college. There has been a sustained effort to increase the number of higher education institutions in remote areas and the effort needs to be continued. Additionally, provision of infrastructure such as manpower, library and computer facility and laboratories in these colleges should attract immediate attention. Inaccessibility to higher education institution in every region can be tracked from huge population and wider area served by an institution. Population and area served is least for primary level institutions and highest in case of college and professional level institutions in every region. Population served is lowest in Region-I and highest in Region-III in the district. The provision of primary, secondary and higher secondary schools increases from Region-I to Region-III implying that more schools are provided to fulfill the need of greater number of population. But this is not the case for college and professional institutions. Inaccessibility scenario for college and professional level institutions is grim when Region-II and Region-III are considered (Figure 5.15). It is well known that social return from elementary education is high. But private return from education is higher in upper level institutions when compared to that in elementary education. The inaccessibility to higher education institutions in the district is so critical that students and parents may not foresee any future private return and lose interest in education even at a lower level. It is to be noted that the accessibility scenario analysis is limited by the fact that some parts of the district are not actually inhabited.
5.4.4 Other Educational Infrastructure

Public libraries take an important role in developing reading habits among people. Such libraries facilitate people who are not able to buy books but are eager to read. The Government of West Bengal is conscious about the fact and a separate ministry controls and supports such libraries. Improvement in literacy rate has led to increase in number of users in these libraries. More and more people are now getting interested in using the facility. Around 10-15 percent of total enrolled users visit libraries in the district per day. There is increase in number of books available in these libraries in consonance with increase in number of users. Free reading rooms are generally complementary to libraries where users can read materials without borrowing them. Such centers are specially helpful for people searching daily newspapers and periodicals. The growth of mass literacy centers and their distribution across blocks and municipalities of the district has led to proper utilisation of public libraries and reading room facilities.

ICDS centers on an average serve 30 students per institution, SSKs serve 110 students per institution and MSKs serve 135 students per institution. Thus special effort to improve infrastructural facilities like drinking water and sanitation, teaching personnel, teaching aids, etc., is needed. Non-formal institutions has achieved remarkably in enrolling girls. Many girl children do not get the access to a formal education system and girls drop out more frequently than boys. Going to school for a girl child is often thought of as a privilege. Poor parents, who can not afford expenditure on education for their children, send their boys to school. Girl children are put to domestic work and have little time for school. Thus there is a need to teach girls close to home and for hours favourable
to them. Non-formal institutions have performed well in providing such an opportunity for girl children in the district. As per estimates for 2004-05, girls’ enrolment in both ICDS and SSKs are around 50 percent of total enrolment.

5.4.5 Non-Formal Education

Non-formal education (NFE) is designed to complement the formal education system. NFE centres are specially meant for students who face accessibility problem or have dropped out. The basic philosophy is to design convenient teaching hours and to bring educational infrastructure nearer to the students. The formal educational institutions are not so distributed that every child willing to join a primary school can get admitted in an institution within 1 kilometer radius from her residence. Non-formal institutions provide them the opportunity to join educational institutions in a nearby place. A large number of non-formal institutions have been established in the district in recent years. Though in some cases these non-formal institutions are sharing the same physical infrastructure used by formal institutions, there are many examples where they have an independent infrastructural facility.

The main forms of non-formal institutions are Integrated Child Development Scheme (ICDS) centers, Sishu Siksha Kendras (SSK), and, Madhyamik Siksha Kendras (MSK). The ICDS centers run by the Department of Social Welfare provide preschooling opportunity for students upto age 6. Special attention in these centers is given to health of the children. Regular monitoring of their health and additional nutritional support are provided to the students. ICDS centers even satisfy the need of a pregnant mother. They are given necessary medical attention and food as a carrying mother is in need of such supports during pregnancy. SSKs are to provide education for students upto class

IV. As in the formal institutions, mid-day meals are provided to the students studying in these institutions. MSKs are meant for providing non formal education to students studying in classes V to VIII.

ICDS centers, SSKs and MSKs in South 24 parganas serve the needs of the backward regions. For all these forms of centres, number of institutions established in Region–I is least and highest in Region–III.

5.5 Education: Quality, Performance, Attainment

Quality is a major challenge in education. Not many students master the curriculum and a few reach the expected level of competency. Under resource based education system, poor quality instructions are the major causes of poor quality education. Insufficient and improper physical infrastructure often hampers quality of teaching. It has been already discussed that the minimum required space of 7 square feet per student is not available in many primary schools in South 24 Parganas. This implies overcrowding within a classroom. This affects quality of instruction adversely. Another indicator, which shows shortage of space and probably affects quality of teaching more adversely,

Number of centers established in 4 educationally backward blocks of South 24 parganas i.e. Canning–II, Basanti, Joynagar–II and Kultali is also impressive. In every region, number of ICDS centers is much higher than number of SSKs and MSKs established. This indicates, as like the formal institutions, there is need to extend the network of non-formal institutions at a higher level of study.

Figure 5.17: Space Shortage in Primary Schools of Educationally Backward Blocks

![Space Shortage in Primary Schools of Educationally Backward Blocks](image)
This means either students of different classes are taught jointly or some classes are taken in open space. An alarming proportion of primary schools in the district of South 24 Parganas across all the regions are wanting physical infrastructure in the form of classrooms required. Whereas around 60 percent of primary schools in both Region-I and Region-III lack minimum necessary classroom facility, the proportion rises above 75 percent in Region-II.

The number of schools, where the number of classrooms is less than the number of classes, in Region-I and Region-III has increased during 2001-2007. This indicates that while attention is given to increase the number of schools, basic physical infrastructural facility is not provided. It may be the fact that newborn schools lack such facilities. It may also be noted, for many of those schools, mere construction of a room does not suffice accommodation of all different classes separately and thus such constructions do not meet the one class one room requirement.

Another factor that affects quality of education is the lack of teaching staff in an institution. The average student teacher ratio in primary schools of the district (above 70 percent in 2001-2002) is poorer than the state average (53 in 2002). Considerable improvement in student teacher ratio has been observed during 2001-2007. To be more specific, student teacher ratio at the primary level improved in every block and municipality during the period. A remarkable increase in student teacher ratio has been observed in Bhangar-I and Kultali. But shortage of teachers is still a major problem in primary institutions of South 24 Parganas. One indicator of shortage of teachers is the number of schools where number of teachers is not greater than number of classes. The indicator identifies the schools where number of teachers is either equal to or less than the number of classes. The first case implies that teachers have to take classes consecutively and continuously, which may affect their productivity and hamper quality of teaching. The second possibility is more critical as it means either a class is not taken or more than one classes are clubbed together to be taken jointly. Such severe shortage of teachers generally means students miss classes regularly and the scheduled syllabus does not get completed in the stipulated time.

The problem of shortage of teachers is not so severe in secondary or higher secondary schools. Upper middle, secondary and higher secondary institutions have to run a maximum of 8 classes from V to XII. The average number of teachers per secondary

and higher secondary school in every block and municipality of South 24 Parganas, except Mathurapur-I, is above 8. But as schools often have to absorb huge number of students in each class and have to run separate sections in each class, the shortage of teachers acquires another dimension. Introduction of para teachers in the educational system has supported the under-resourced system by increasing average number of teachers per school and lowering the student teacher ratio. Whereas around 10 percent of total teachers are para teachers in primary schools, the proportion is around 20 percent in upper primary schools. A good percentage of teachers in secondary and higher secondary schools are trained. Trained teachers are specially equipped and that improves the teaching learning process.

Provision of two other infrastructural facilities has become indispensable in secondary and higher secondary schools. One of them, the library facility, is provided in almost all secondary and higher secondary schools. The impressive performance is seen in all regions of the district. Library facility in schools in backward areas is more important as students who cannot buy books generally rely on books borrowed from the library. Only 3 percent of secondary and higher secondary schools in the Sunderban region does not have a library. The district has made enormous progress in providing library infrastructure in secondary and higher secondary schools. Now time has come when more effort to improve the quality of the library by increasing number of books and engaging trained librarians should be undertaken. Provision of computers in secondary and higher secondary schools has also become necessary in recent times. There is no denying the fact that students need to be computer literate in their school days. Computer knowledge improves skill that has far reaching positive effects in the employment market. The provision of computer facility in schools virtually has not started in the district. The benefit that has been received is reaped by Region-I. Whereas 35 percent of secondary and higher secondary schools in Region-I are provided with computer facility, only 12 percent of schools in Sunderban have the computer facility.

Performance of students in schools is influenced by quality of teaching. A student completing the course in the stipulated number of years is a sign of proper learning of the curriculum. A student entering a primary school in class I is expected to complete primary schooling in 4 years. Similarly a student entering in class V should pass class VIII level in 4 years. The

cohort study, results of which were shown earlier (Tble 5.6), shows that schools in municipal areas have a higher proportion of students completing the course in stipulated number of years than in block areas. Rajpur Sonarpur municipality is a notable exception. Both Rajpur Sonarpur municipality and its adjacent block of Sonarpur, though situated in the outskirts of Kolkata, are poor performers with

![Figure 5.18: Performance of Students in Primary and Upper Primary Schools](image)

![Figure 5.19: Performance of Students in Madhyamik Examination (2007): The State and the District](image)
respect to the said indicator. Sagar and Namkhana, two blocks of the Sunderbans that performs well in literacy, have a relatively good performance in terms of students completing their school in primary and upper primary level in the stipulated number of years. The performance of students deteriorates at the upper primary level. There is no block in the district where 50 percent of enrolled students completed upper primary level in 4 years (Figure 5.18).

Source: Rural Household Survey (2004-05)
Ranks are calculated for a list of 29 blocks of the district of South 24 Parganas. The highest is ranked 1.
The performance of South 24 Parganas at the next higher level is impressive. The result of the Madhyamik examination of 2007 reveals that the percentage of successful candidates in South 24 Parganas was higher than the pass percentage achieved by the whole state. Performance of examinees of the backward groups was also better than that achieved in the state as a whole.

Performance at a higher level is expected to be influenced by the provision and accessibility to the infrastructure, level of development, economic condition of households, etc. The Rural Household Survey 2005 classified households in terms of education level attained by the highest educated person of a household in each block. The proportion of households in which the most educated person has studied above class X level can be estimated for each block. The results show (Table 5.18) that blocks in Region-I have generally achieved more in this aspect. This may be due to the fact that people in this region have better access to higher education infrastructure and it becomes easier for them to access facilities available in the district of Kolkata. A strong rank correlation coefficient of 0.72 between the incidence of poverty and proportion of households in which the most educated person has studied above class X level establishes that attainment on education in relatively prosperous blocks are better than that in income poor blocks. A number of households probably cannot continue higher studies due to relatively constraints in poverty stricken blocks. It is most unfortunate that higher level education infrastructure is almost non-existent in many remote blocks of South 24 Parganas.

Educational attainment has some positive effect on society. Educational attainment by one individual encourages others to get educated. The societal attitude towards education in an educated area is more conducive for spread of education than in an educationally backward area. This can be seen from higher enrolment and lower dropout rate in an educationally advanced area. Educational attainment is important as it controls the rate of drop out at the elementary level. The rank correlation coefficient between blockwise proportion of households in which the most educated person has studied above X level and the corresponding rate of drop out at the primary stage is 0.45. The same coefficient at the upper primary stage is 0.46. Educational attainment thus has a positive impact on controlling drop out rate.
5.6 Special Programmes on Education

Education is in the concurrent list in the Constitution of India. Both the Central and the State governments finance several programmes on education. The district administration makes sincere efforts to implement these programmes so that the fruit reach the educationally backward. The total literacy campaign (TLC) was launched in the district in the month of February, 1992. The target population at the time of beginning of the programme was around 10 lakhs. The TLC programme was successful to make more than 80 percent of the 9-14 age group children and around 73 percent of 15-50 age group population, literate. The importance of post literacy programme (PLC) to fulfill the needs of literate population, so that the neoliterates do not lose their literacy status, started with fanfare in the district. The evaluation of PLC learners revealed that more than 85 percent of learners scored more than 70 percent in the evaluation. The continuing education programme (CEP) was launched in the district in 1999 after the completion of the PLC programme. The basic objective of the programme was to upgrade literacy skills of the neo-literates so that they can be involved in income generating opportunities. CEP provides learners an opportunity of lifelong learning according to their need and choice, development of human resource through self learning, thinking skills, etc. CEP was specially designed to ensure participation of people from all sections of the society and converge the programme with other development programmes. The successful running of CEP in the district was observed from increase in number of beneficiaries in recent years (Figure 5.20).

Sarva Siksha Abhiyan (SSA) is a

### Literacy as a Tool of Empowerment: Continuing Education Center (CEC) Based Self Help Groups

Income generation programme (IGP) is one of the programme under continuing education programme. One feature of IGP is formation of CEC based self help groups (SHG) by the Preraks. In 24 Parganas(S) total 72 numbers of such SHGs have been formed till now and some of these groups have undergone skill development training imparted by Jana Sikshan Sangsthan, Narendrapur. The Prerak of Simla CEC in Khorda Gram Panchayat under Diamond Harbour-II Block has formed one such SHG named ‘Sandhani’. Sayeeda Rajina Khatun, the Prerak of the CEC is acting as secretary of the SHG. The SHG has undergone training on ornamental pisciculture organised by Zilla Saksharata Samity, 24 Parganas(S). At present the members of SHG have taken loan from bank and started a business of supplying ornamental fish in different shops which has increased their income and fulfilled their dream of being self reliant.
programme to universalise elementary education, ensure students complete their study and offer quality education. SSA was launched in the district after successful completion of District Primary Education Programme (DPEP). The targeted time frame was fixed to universalise elementary schooling and retention by 2010. The main objectives of SSA are to promote social justice through basic education, bridge gender and social category gaps and to ensure quality education for quality of life. The programme stressed on sustainable partnership among Central, State and Local governments. A major thrust is given on community partnership by involving panchayat raj institutions, school management committees, village and ward education committees and parent teacher associations. The novelty of SSA is that such a structured and component wise programme to improve education scenario was not implemented earlier.

Another major programme on education that has received attention in recent years is the mid-day meal programme. The basic objective of the programme is to offer incentive to the primary school going children to join and attend school. It has been widely seen that mid-day meal programme has resulted in increase in enrolment and attendance in primary schools. At an early stage of the programme, children were given edibles and generally a particular day in a month was chosen for the distribution. Now cooked food is distributed in all primary schools of the district. It has been now decided that mid-day meal programme will run up to class VIII in educationally backward blocks of Canning-II, Joynagar-II, Kultali and Basanti. The responsibility of cooking has been
entrusted to a self help group of the village. The official grant earmarked for the mid-day meal scheme is 100 grams of rice per head per day and Rs. 2.50 per head per day. The schools are given the said amount according to their enrolment and for a maximum of 20 days in a month subject to a maximum of 222 days in a year. Barring some minor problems, the programme of mid day meal is running smoothly in the district and an amount of around 15 crores has been spent during April 07-October 07. It is observed that the sections of the society who were almost never keen on schooling are now turning up.

In spite of undertaking various activities for girls education, it has not been possible to make any major breakthrough in areas dominated by SC, ST, OBC, and, minority communities. In some of the areas, migratory population or the practice of child labour have posed major problems. The most important factor that has impact on retention and quality assurance for girls is the societal attitude towards the necessity of educating the girl child, specially at the upper primary level. Hence, the National Programme for Education of Girls at the Elementary Level (NPEGEL) has been designed for undertaking more intensive gender interventions in these pockets. This is in addition to the ongoing process of SSA. It has been seen that a girl child friendly environment in schools helps the cause of girls’ education. NPEGEL promotes developing adequate gender sensitive infrastructure, mobilisation of women groups and female panchayat members to sensitise educational issues of the girl child, convergence of formal and non-formal institutions to facilitate girls’ education and to concentrate on educational issues of girl child.

The Government of India has approved a new scheme called Kasturba Gandhi Balika Vidyalaya (KGBV) for setting up residential schools with boarding facilities at elementary level. The infrastructure will be built in remote areas belonging

predominantly to the SC, ST, OBC, and minorities. The scheme will be coordinated with the existing schemes of Department of Elementary Education and Literacy e.g. SSA, NPEGEL, etc. Schools at Howramari in Canning-II, Janapriyanagar Janapriya in Basanti, Jamtala Bhawan Chandra in Kultali and Nolgoradham Baikuntha Vidyapith in Joynagar-I have been already covered by this program. The efficient running of these government programmes can be seen from increase in number of beneficiaries in recent years.

5.7 Problems and Prospects: The Path Ahead

The attainment of the district on education is encouraging. But there is no scope of complacency and much is yet to be done. This is time to consolidate and to make sincere effort to improve upon those aspects that were not properly attended. The achievement of the district in reducing illiteracy, specially when decadal growth in literacy is considered, is impressive. The same holds true when decadal growth in female literacy and reduction in gender gap in literacy are considered. But literacy in some backward pockets and for some underprivileged social group is miserable. Thus there is need of geographical, social group-based targeting of literacy policies. The initial goal should be to plan in such a manner so that there will not be any educationally backward block in the district in near future. Gender friendly non-formal institutions and literacy centers should be established to reduce gender gap in literacy.

The performance in school enrolment clearly gives a sign that the district in near future will achieve the target of universal enrolment. But the real problem is the rate of dropout. Dropout rate at every stage of education is alarmingly high. Female enrolment falls drastically when the age of marriage is approached. Thus there is need to provide some incentive to retain girl students. The system of mid-day meal has well known positive impact on retention. The programme should be extended to the upper primary level at least for girl students in all blocks and municipalities of the district. Introduction of financial grant can be effective to retain girls at a higher level of education.

The involvement of the community can be effective in reducing dropout or to take the dropped out students back to the classroom. A retention drive with community and parents of dropped out children is sure to be effective. Apart from management and monitoring of schools,
### Achievements

- Impressive decadal increase in female and aggregate literacy rate.
- Most of the blocks and municipalities registered an impressive growth in literacy during 1991-2001. Performance in blocks is slowly catching up with that of municipalities.
- Whereas there were 16 blocks having a gender gap in literacy above 30 percent in 1991, there is no block in that category in 2001.
- Almost universal enrolment for the 5-8 age group children. Every block and municipality has an enrolment ratio above 85 percent for 9-14 age group children. Enrolment of backward group children is also satisfying.
- Impressive girls’ enrolment at the primary and upper primary level. Enrolment of girls coming from backward groups also worth mention.
- Widespread primary school infrastructure across all regions. Moderate progress in provision of basic amenities like drinking water and sanitation in primary schools.
- Moderate proliferation of secondary and higher secondary, and, college and professional level institutions.
- Commendable achievement in establishing ICDS and SSK centers.
- Increase in number of beneficiaries in government educational programmes.

### Areas of Concern

- Aggregate literacy rate is not impressive when compared to other districts of West Bengal. Literacy rate among ST’s is miserable.
- A significant rural urban gap in literacy still exists.
- Canning-I, Canning-II, Basanti and Joynagar-II are the four blocks where female literacy rate is less than 50 percent.
- Huge dropout of students at primary and upper primary stage. Canning-II has a dropout rate above 50 percent at the upper primary level.
- Female enrolment falls at the higher levels of education. It falls drastically when the age of marriage is approached.
- Shortage of space is the most crucial infrastructural bottleneck in primary schools. Proportion of schools where number of classrooms is less than number of classes is alarmingly high. Lack of teachers, manifested by number of schools where number of teachers is not greater than number of classes, is also a matter of concern.
- The burden of a college institution in terms of average population served and average area served is too high.
- Relatively inaccessible higher level non formal educational institutions.
- Lack of co-ordination of educational programmes with programmes of other departments.
the members of the local government should be held responsible and involved in the task. Involvement of women teachers, women guardians, self help groups and ensuring earnest effort from them is necessary to control dropout of girl children. This is time that the graveness of the problem is acknowledged and necessary attention is paid and policies taken to check the rate of drop out.

Provision of educational infrastructure at the primary level is more satisfactory when compared to educational institutions at a higher level. Student teacher ratio, number of students per school increases substantially in secondary and higher secondary schools when compared to a primary school. Inaccessibility to college level infrastructure in the district is a well known obstacle to higher education. Thus, along with consolidation of achievement at the primary level, proliferation of higher level institutions should be sincerely targeted. The quality aspects of education by improving physical infrastructure and full time teaching personnel should get attention.

Non-formal institutions are often thought as second grade institutions lacking adequate infrastructure and even an independent physical infrastructure in some cases. Provision of additional infrastructural facilities for non formal institutions should also receive attention. As non formal institutions intend to support education of girl child, female teachers in large numbers should get employment in those institutions.

Government programmes on education aims at improvement of educational scenario of the district. The successful running of adult education centers has resulted in eradication of adult illiteracy to a large extent. These programmes cannot sustain if such programmes are not linked with employment generation opportunities. Continuing Education Centers provide such employment opportunities. But there is need to converge the literacy programmes with other developmental programmes. Training to establish fishery, livestock rearing can provide additional employment opportunity for learners. The mid day meal programme, for more successful operation, should involve the mothers in monitoring. Contributions of parents, local government are necessary to improve quality of food and to offer students the facility when a school runs more than 222 days in a year.

It is observed that achievement on education does not concentrate in any particular region of the district. Though blocks and municipalities of Region-I, as situated around Kolkata, are more favourably placed than Region-II and Region-III, performance of some blocks
and municipalities of Region-II and Region-III on literacy and enrolment matches performance attained in some parts of Region-I. But the rural urban gap in every region is still huge and steps to bridge the gap is necessary. The regional difference in provision of infrastructure at higher level of education is clearly observed. This has impacts on educational attainment. The region of Sunderban has not yet equalized with other regions when higher level education is considered. Hence fund flow for educational development of Sunderban should continue.

Lack of basic education is a denial of fundamental right. Decisive actions at the grass root level under the umbrella of district administration are sure to improve the scenario.
HEALTH STATUS IN SOUTH 24 PARGANAS

Along with education, health is the most important human development indicator. It is crucial in determining the level of welfare of individuals and the community. Health is important not only as a target important for its own sake, but for enabling the individual to access or utilize the facilities and services available to the person. Provisioning of health services to the community is therefore crucial in any economy, and more so in developing economies. In particular, policy makers must ensure equitable access to the health care system, by providing cost effective health services (as recognized in the Alma-Ata “Health for All” initiative undertaken by the World Health Organisation in 1978) and facilities to the poor especially in rural areas. Such intervention characterizes an effective and socially acceptable approach to poverty reduction.

6.1 Healthcare Institutions in South 24 Parganas: A Stock-taking

6.1.1 Institutional Network

State healthcare system in South 24 Parganas comprises a total of 99 healthcare institutions under the control of CMOH, 141 private healthcare institutions, 5 institutions run by Local Bodies, 1 by Labour Department under State Government (SGL) and 1 by Central Government (CG).

Source: Office of CMOH, South 24 Parganas

Healthcare institutions under the control of CMOH include District hospital (DH), Sub-division Hospitals (SDH), Rural Hospitals (RH), Block Primary Health centers (BPHCs), Primary health centres (PHCs) and sub-centres (SCs). The health sub-centers are functionally grouped into government clinics and dispensaries (Table 6.2).
The three-tier referral health care system is as follows:

- At the lowest level we have Government clinics and dispensaries, which offer only outpatient treatment,
- PHCs providing basic in-patient facilities,
- Government Hospitals situated at the block, sub-division and district head quarters, offering full fledged out-patient and in-patient services to the district population.

On an average, for each SD and SG hospital-level healthcare facility there are 3 RHs/BPHCs; each RH/BPHC has under its control 2 PHCs and each PHC has 17 SCs under its control.

It can be seen from Table 6.3 that over time there has been an increase in all health care facilities. There has been an increase in the number of Hospitals and particularly in the number of Clinics after 1999. While upgrading has led to a marginal decrease in Health Centres between 1999 and 2004, there has been a some reduction in number of beds. This is an unwelcome trend that should be reversed.

The GIS map of villages of the District shows that there are a large number of villages without medical facilities. Further, these are not concentrated in the Sundarban Region but also occur in the North-Eastern part of the district and even on the periphery of Kolkata.

### 6.1.2 Settlement Density and Infrastructure

Apart from the infrastructural set-up other important issues are size of the health care service sector and the size of the population for whom they extend health care coverage. Table 6.4 examines the situation with respect to different blocks in South 24 Parganas for some critical parameters. For analytical purposes the blocks are divided into three principal regions:
- Region-I: North West (Kolkata Surroundings),
- Region-II: North East and Mid West, and
- Region-III: South (Sundarbans)
Figure 6.1 Availability of medical facilities in south 24 parganas
The volume of health care services is measured in terms of the physical infrastructure (consisting of the number of SCs, PHCs, BPHCs and RHs) Medical Officers, Nurses, Health Assistants, Pharmacists and Technicians.

It can be seen that Region-I has the lowest population, and Region-III the largest population. We would expect that the parameters studied would also increase...
A trend can be observed in general with two exceptions – the increase in number of beds and technicians and pharmacists between Region-I and Region-III is substantially less than the increase in population between these two regions. On the other hand, the increase in the physical infrastructure and manpower is significantly higher than the population increase between Region-II and Region-III. However, this analysis merely examines whether the expansion in health infrastructure has been commensurate with respect to the increase in population – it does not take into account whether the health infrastructure is capable of supporting the population pressure or not. The latter analysis is undertaken subsequently.

The regional perspective also hides the considerable block-wise variations. For instance, Mandirbazar (Region-II), ranking eighth according to population, has a poor infrastructure – both physical and service providers. Region-III blocks like Patharpratima, Basanti, and Mathurapur I also have very high populations (second, third and fourth highest, respectively). However, while Basanti has a satisfactory number of RHs/BPHCs and Sub-Centers, the number of beds (in hospitals) and medical staff is very low. Similarly in Patharpratima, the number of doctors and nurses is inadequate. Mathurapur I has a satisfactory physical infrastructure, but the staff strength is low. A contrasting picture of plenty can be seen in Sagar where the population is low, but both staff and particularly the physical infrastructure are very satisfactory.

An interesting ratio is that of the number of BPHCs, RHs and SDHs to the number of Sub Centres. While the former provides in-patient admission facilities, the facilities extended by Sub Centres is limited to out-patients. This ratio does not vary substantially across blocks in each region – the coefficient of variation in the three regions are 48%, 43% and 34% – but varies significantly across all blocks in the District (coefficient of variation is 80%). This variation is the highest in Region-I, adjoining Kolkata, and lowest in the Sundarban region.
It can be seen that the health infrastructure in blocks is not always consistent with the demographic pressure. This is reflected in indicators like Bed Occupancy Rate (BOR), Bed Turn Over Rate (BTOR), Emergency Admission Rate (EAR), and Delivery-Admission Ratio (DAR).

The aggregative performance appears relatively satisfactory and compares favourably with existing standards accepted by the Health Department, Government of West Bengal (see Figure 6.2). Thus, BOR – reflecting the extent to which existing facilities are utilized – was within the norms in 2004. In 2005, however, it fell by 7 percentage points to a level that is marginally below the WHO norm. The BTOR indicates the load on the health infrastructure. The performance is slightly better in this regard, as BTOR level has increased from 2004 levels by 5 percentage points, and attained the accepted standards of 72-96%. The problem with these figures is that they may be interpreted as evidence that people are ‘healthier’ and do not have to access health services. In reality, these figures are more likely to reflect the low reliance of the population on public health services. In reality, these figures are more likely to reflect the low reliance of the population on public health services. This is supported by the low figures for EAR and DAR. While the standard for EAR is 40-45%, the actual rates were lower in 2004 and just attained the standard in 2005. On the other hand, deliveries are expected to constitute the major share of admissions, particularly in a District with low average age of marriage and long period of fertility. However, the extremely low figures for DAR clearly indicate that institutional deliveries are relatively few. This issue has been discussed in greater details in a subsequent section. Data from Health on the March, published by the State Government, also shows that the proportion of major and even minor surgeries is relatively low in the public sector.

It is of course possible that the proximity of most of the blocks to Kolkata enables the district population to readily access hospitals in the latter. While this may explain why pressure on the District health facilities is low, it would also indicate a break-down of the three-tier referral system, lying at the core of decentralization of health facilities.

BOR is worst in Garden Reach SGH, followed by Bijoygarh and Bagha Jatin SGH. A considerable extent of under-utilisation of existing facilities – reflected in a low BOR - is also seen in Diamond Harbour and Vidyasagar SGH. The load on the health infrastructure is reflected in BTOR. The worst performance is by Diamond Harbour SGH, followed by Garden Reach and Baruipur SGH. EARs are substantially below the norms indicating the inability of SGHs to address the needs of patients.

Apart from the referral institutions, the
situation in blocks is also worth examining. This is not an easy task as there are considerable block-wise variations. Only six blocks out of 29 have satisfied norms

Source: CMOH (South 24 Parganas)

NOTE: Since complete data not found for BTOR, the aggregate percentage for BTOR was not calculated
for BOR – Kultali, Falta, Mathurapur-II, Kulpi, Namkhana and Sagar. It is worth noting that four out of these blocks are in the Sundarban region where transport links to Kolkata are not so well developed, thereby forcing the population to avail of local public health facilities. Thus, in Patharpratima (also in Sundarban), the load has exceeded the standards significantly (131, against the norm of 75-100). Under-utilisation of services is found in many blocks. BOR is particularly low in Thakurpukur-Mahestala Block, Baruipur, Bishnupur-I (adjacent to Kolkata) and Canning-II. In all, BOR is below 50 in 11 blocks out of the 27 blocks for which data is available. Out of these 11 blocks, six are located in Regions I and II.

The block-wise situation with respect to BTOR is equally concerning. The pressure on public health facilities is excessive in the RH/BPHCs at Diamond Harbour-I (almost double the standard), Joynagar-I, Namkhana, Patharpratima (where BTOR exceeds norms by more than 70%), Sonarpur, and Magrahat I, and Amtala. The unevenness in spatial distribution of health infrastructure is seen from the fact that in almost one out of three blocks BTOR is below 50%. Levels are particularly low in Magrahat-II (5.6), Canning I (13.3) and Kultali (21.4).

The low rates of BOR and BTOR have important consequences for policy makers. The under-utilization of BPHCs/RHs in many of the blocks indicate that the reach of these institutions remains limited. This raises questions about PHCs and Sub-Centers. Their effective functioning can attract people to the public health facilities, and ensure effective utilization of middle level referral institutions (BPHCs/RHs) through the operation of the referral system.

In contrast to data published in *Health on the March: 2005* for the state (see graph above) it can be seen that EARs have not even remotely approached standards in any of the blocks, except Diamond Harbour-I. Except in BPHCs at Patharpratima, Bhangar-I and Canning-II, Joynagar-I RH, and in Diamond Harbour SDH, the proportion of deliveries to admissions is quite low, and deliveries constitute less than a third of total admissions.

Overall, the most concerning feature is the low reliance of the public on the District healthcare system. In the absence of a survey of District Hospitals, it is not possible to identify all the causes of this phenomenon. We would recommend that the Health Department undertake a regular stock taking to identify the nature of deficiencies in different units – where functional machines are lacking, where beds are in short supply, where posts are lying vacant, where attendance of doctors are irregular – and take steps to remedy the shortcomings. This would rejuvenate the District health infrastructure and build trust in the system among the public.
6.3 Carrying Capacity of Healthcare System

6.3.1 Infrastructure with respect to Population Pressure

Absolute figures of physical infrastructure and health personnel do not provide a meaningful picture of the extent to which the infrastructure is equitable across blocks. To overcome this limitation, population figures must be incorporated into the analysis. In this section we will first estimate the healthcare parameters after adjusting for block population. In the next section we will compare the block-wise situation (adjusted for population) with existing national norms for the parameters.

In South 24 Parganas the number of beds per ten thousand population is the highest

</table>
in Kakdwip, followed by Mathurapur-II, Sagar, Budge Budge-I and II, Canning-I. It can be seen that four out of these six blocks are in the Sundarban region. The position is concerning in Thakurpukur-Mahestala, Falta and Mandirbazar blocks.

In the case of number of doctors per lakh population, the situation is satisfactory in Kakdwip, Canning-I, Namkhana (in Sundarban Region), Baruipur and Sonarpur (Region-I). The number of doctors has to be increased substantially in Basanti, Canning-II, Gosaba (Sundarban), Mandirbazar and Thakurpukur-Mahestala.

The dependence of the population on the public health system is measured by the proportion of patients to population. This figure is high in Budge Budge-I and Diamond Harbour-I, but is lower than 10% in Bishnupur-I, Kulpi, Mathurapur-I, Budge Budge-II, Diamond Harbour-II, Gosaba, and Basanti. The proportion of out-patients is substantially higher than the proportion of ward patients. The block-wise variation is therefore similar to that for total patients. In the case of in-patients, the situation is satisfactory in Diamond Harbour-I and Joynagar-II, but lower than 1% in Bishnupur-I, Kulpi, Mathurapur-I, Magrahat-I, Thakurpukur-Mahestala Block, Mandirbazar, Baruipur and Canning-II.

Now it is to be expected that the existence of health facilities and doctors would encourage a greater dependence on public health facilities. For instance in Budge Budge-I, the number of beds per population is high and the number of doctors per lakh is also high, the percentage of patients to total population is high. On the other hand, Kakdwip and Canning I, despite having satisfactory beds and doctors per population, have failed to attract the population to the public health sector to the same extent. We have therefore estimated a correlation matrix between these parameters. This matrix shows that while there is a strong association between beds per 10,000 population and doctors per lakh population, the correlation of both these infrastructural parameters with the proportion of patients in population is fairly weak.

| Table 6.7: Correlation Matrix between Blockwise No. of Beds, No. of Doctors and No. of Patients (adjusted for Population) |
|---------------------------------------------------|---------------------------------|---------------------------------|
| No. of Beds per 10,000 Population | No. of Doctors per lakh Population | % of Ward Patients to Total Population | % of Outpatients to Total Population | % of Total Patients to Total Population |
| 1 | 0.723805 | 0.316698 | 0.2832 | 0.290417 |
| No. of Doctors per lakh Population | 1 | 0.240788 | 0.340442 | 0.342668 |
| % of Ward Patients to Total Population | 0.316698 | 0.240788 | 0.340442 | 0.342668 |
| % of Outpatients to Total Population | 0.2832 | 0.340442 | 0.342668 | |
| % of Total Patients to Total Population | 0.290417 | 0.342668 | | |
6.3.2 Infrastructural Gaps following existing National Norms

The above analysis indicates that there is scope to improve the situation with respect to the provisioning of health infrastructure. This raises the question as to the extent to

</table>
which the existing set up must be expanded. In this section we attempt to estimate the number of additional Sub Centres, PHCs, Community Health Centres (CHCs) and Female Health Assistants (FHA) required in the district.

Based on the national norms for provisioning of health infrastructure, the number of such units required in each block has been estimated. This is then compared with the actual number of units currently existing to measure the infrastructural gap.

The health infrastructure in most of the blocks are characterised by varying extents of deficiency. Only in the case of Sub-centres in Sundarban blocks is there a surplus – with the exception of Mathurapur-I, where there is a large deficit.

The average level of deficit with respect to number of PHCs, SCs, CHCs and FHAs are 5, 4, 1 and 171 per block, respectively. The actual extent of deficit does not vary substantially across blocks except in the case of Sub-centres. In case of the latter, Baruipur, Mandirbazar and Mathurapur-I have the highest deficiency.

### 6.3.3 An Overall Assessment of Carrying Capacity

The correlation matrix of deficits in these four parameters shows that blocks with deficits in CHCs and FHAs also have high deficits in PHCs. Similarly, blocks lagging behind national norms with respect to CHCs also lag behind in number of FHAs. Based on this analysis, we recommend that investment be undertaken in all four parameters (PHC, SC, CHC and FHA) – it is not enough to single out any of the four parameters for specific attention while making block-wise plans.

### 6.4 Endemicity of Diseases in the District

#### 6.4.1 Vector Borne Diseases

Inhabitants of backward villages of South 24 Parganas, specially of the riverine blocks of the Sundarban area, suffer from malnutrition and various diseases of which vector borne diseases and water & food borne diseases are
of prime importance. Due to their poor socio economic status, low level of education, inadequate sanitation, unsafe water supply and poor housing facilities, people of this district suffer from vector borne disease like Kala-azar. Malaria is also on the rise, while the incidence of Filaria remains another area of concern.

A total of 1766 cases in *Kala-azar* were recorded in the district from 2001 to 2006. But the number of cases has decreased significantly from 351 to 140 between 2005 and 2006.
and 2006. Ten blocks have reported cases of Kala-azar, out of which 4 blocks of Canning Sub Division (Canning-I, Canning-II, Gosaba, Basanti) are endemic blocks. The highest number of cases has been reported from Basanti block as follows: 2006- 86 cases, 2005- 331 cases, 2004- 666 cases, 2003- 84 cases, 2002- 104 cases, 2001- 75 cases. Though endemicity of the disease is reported from all parts of the block, GP Phul Malacha and Kathalberia are the villages most affected. There has been one death due to Kala-azar in the year 2006 in Gosaba block. A blockwise report of Kala-azar for most affected blocks is given in Table 6.12.

Another vector borne disease that recurs with regular frequency in South 24 Parganas is **Malaria**. In 2006 951 cases were reported, mainly from Canning Sub Division (Canning-I, Canning-II, Gosaba, Basanti), Diamond Harbour Sub Division (Diamond Harbour-II, Magrahat-I, Kulpi, Mathurapur-II) and Namkhana blocks. One fatality each was also reported from Canning-I, Sagar block and Kulpi block in 2006.

Attempts to combat such diseases fall under the National Vector Borne Disease Control Programme (NVBDCP). Regular spraying programmes are carried out in **Kala-azar** and Malaria prone areas. National Anti Malaria Programme (NAMP) is another attempt to eradicate Malaria. Attempts are made to sensitize residents about the benefits of using mosquito nets. Radical treatment for those who have caught either of the two diseases has usually managed to avert fatalities. Advocacy workshops are also conducted on a regular basis in the ten affected blocks for **Kala-azar**.

The economic costs of such diseases are substantial, particularly if the bread earner is affected by the disease. To reduce such costs, the Office of the Chief Medical Officer, South 24 Parganas, had proposed introduction of the following package in 2007:

- Compensation of the daily wages of the **Kala-azar** patient admitted in Hospital. This will entail an outlay of Rs.7.28 lakhs.

Source: Office of CMOH
Medicated mosquito net to be distributed free of cost to poor needy families living in *Kala-azar* affected blocks. The total cost of this component will be Rs.25.8 lakhs.

Another Rs.12 lakh will be spent on providing water filters in arsenic affected areas.

Provisioning of temporary support for laboratory support for each block with a microscope for diagnosis of vector-borne diseases. This will cost Rs.3.48 lakhs.

The total number of persons affected by *Lymphatic Filariasis*, another vector borne disease, in 2004-05 was 1542, out of which more than 50% were detected from Canning-II (289 cases), Kulpi (133 cases), Mathurapur I (121 cases), Diamond Harbour-I (104 cases) and Magrahat-I (102 cases). Almost half of the reported cases pertained to Hydrocele.

The basic strategy of intervention is Mass Drug Administration, based on a single dose of Diethycarbamazine Citrate (DEC). This is a relatively cheap method of intervention compared with other vector control strategies. The drug is safe and effective for human lymphatic filariasis. In the first case, it is usually the patient who is in need of help and therefore he or she is more likely to comply with the treatment. This reduces morbidity of affected persons and interrupts disease transmission. In a community, however, only a small proportion of the population is suffering from acute clinical filariasis at any one time and therefore only a few people will feel the need for help.

### 6.4.2 Water and Air borne Diseases

Among water borne diseases the incidence of *Diarrhoea* in the District is alarmingly high, with 1.27 lakh cases being treated in 2006. The number of fatalities that year was 32; this amounts to 6.53% of the total diarrhoea cases occurring in West Bengal and 4.93% of total death due to diarrhoea occurring in the state. A review of diarrhoeal diseases for the last 5 years show that the incidence of the disease reported to hospitals has decreased gradually regarding number of cases. However, the number of cases reported to indoor due to Diarrhoea has increased substantially over the last three years (31862 in 2006 compared to 21206 in 2005 and 9134 in 2004). The incidence of death has also increased compared to last year.

The blocks of Canning I/II, Mandirbazar, Budge Budge-I as well as Magrahat I are diarrhoea prone blocks reporting high incidence through the year, peaking substantially during the rainy season from June to October. Poor water supply and environmental sanitation are major causes of the high incidence of diarrhoea in these above mentioned blocks. Since diarrhoeal infections spread through the use of contaminated water, the District Health Action Plan 2007-08 is emphasizing on focused intervention that combines the
provision of safe drinking water to rural residents with improved sanitation and mass education on the effective use of oral rehydration therapy.

**Enteric fever** is another water-borne disease posing a severe health hazard problem. A total of 2546 cases were reported in 2006 compared to 7152 cases reported in 2005 – that is a decrease of 35.6%. The maximum number of cases of this water borne disease has been reported from the riverine blocks of Gosaba, Canning I and II, Mandirbazar, Namkhana, Sagar and some blocks of Alipore Sub Division like Budge Budge-I & Bishnupur-I. The lone death due to Enteric Fever has occurred in Canning-I block during 2006. The main causes for the endemicity of the disease is contaminated food and water, particularly in remote riverine blocks and slums in Budge-I block. Low education levels in blocks like Magrathat-I and II, Mathurapur-I and II and high rates of migration from other neighbouring areas pose major problems in controlling the spread of enteric fever.

The total number of cases reported of *Viral Hepatitis* in 2006 was 314 (with no death) compared to 531 reported cases in 2005, with 1 death. There has been a decrease of 59.1% in the reported incidence of the disease. The majority of the cases has been reported from Matherdighi, Namkhana, Sarisa, and Amtola Rural Hospitals and Vidyasagar State General Hospital. There has been one outbreak in Matherdighi between September to December last year due to flood and cyclone in the first week of October. The main reasons behind the endimicity of disease in Canning-II block are poor quality of food and water supply and low level of education.
**Arsenicosis** is another major health issue in South 24 Parganas. A total of thirty-six cases with one death in have been reported till June 2006. In earlier years thirty-eight and ninety-nine cases were reported in 2005 and 2004 respectively, without any deaths. In 2004 the highest number of cases had been reported from Baruipur (58 cases) followed by Bhangar-I (38 cases). In Baruipur 14 GPs and in Bhangar-I and II 34 GPs had been affected by this problem. All the Arsenic affected nine blocks have completed advocacy training and BCC for NGOs and panchayat personnel, AWW and CHGs and are running Arsenic clinics. Government intervention has resulted in Baruipur being the only block still reporting a large number of cases (31 cases in 2006).

Airborne diseases also pose a major threat to different regions of the District. A review of report of last five years shows that incidence of **Respiratory and Lung diseases** are continuously increasing, mainly due to the significant increase in air pollution. In 2006, 110719 cases of Acute Respiratory Infection were reported with twelve deaths, compared to 117602 cases along with thirty deaths in 2005. Pneumonia is another airborne disease generating high risk. The total number of cases reported in 2006 is 4969 with twenty-five deaths compared to 2199 cases with nineteen deaths in 2005. Thus there has been an alarming increase of 125% of incidence of Pneumonia with an increase of 31.5% deaths in 2006 compared to that in 2005. Details of OPD and IPD patients show that the attendance of patients for indoor treatment has increased from 583 cases in 2005 to 2070 cases in 2006 – an increase of 255%. Block-wise analysis indicates that Gosaba, Diamond Harbour-I, Bishnupur-I, Baruipur, Mandirbazar, Kulpi, Canning-I and Budge Budge-I blocks should be targeted for intervention. Intersectoral Coordination Meeting with general administration, Environmental Department and NGOs as well as training of PMWs for early detection of the diseases to prevent mortality are necessary to manage the outbreaks of these airborne diseases.

### 6.4.3 Revised National Tuberculosis Programme (RNTCP) and HIV Control

Tuberculosis continues to be a major health problem and number one killer of adults among all infectious diseases in India. The Revised National Tuberculosis Programme (RNTCP), based on the DOTS strategy, began as a pilot project in 1993 and was launched as a national programme in 1997. Rapid RNTCP expansion began in late 1998. Under the RNTCP, suspects are examined for TB, free of charge. The diagnosis of these patients and the follow-up of patients on treatment are
achieved through the examination of more than 50,000 laboratory specimens.

In the first phase of RNTCP (1998-2005), the programme’s focus was on ensuring expansion of quality DOTS services. The RNTCP has now entered its second phase in which the programme aims at firstly consolidating the gains made to date, to widen services both in terms of activities and access, and to sustain the achievements for decades to come in order to achieve ultimate objective of TB control in the country.

All components of new ‘Stop TB Strategy’ are incorporated in the second phase of RNTCP. These are:

- Pursue quality DOTS expansion and enhancement, by improving the case finding and cure through an effective patient-centred approach to reach all patients, especially the poor.
- Address TB-HIV, MDR-TB and other challenges, by scaling up TB-HIV joint activities, DOTS Plus, and other relevant approaches.
- Contribute to health system strengthening, by collaborating with other health programmes and general services.
- Involve all health care providers, public, nongovernmental and private, by scaling up approaches based on a public-private mix (PPM), to ensure adherence to the International Standards of TB care.
- Engage people with TB, and affected communities to demand, and contribute to effective care. This will involve scaling-up of community TB care; creating demand through context-specific advocacy, communication and social mobilization.
- Enable and promote research for the development of new drugs, diagnostics and vaccines. Operational Research will also be needed to improve programme performance.

The Revised National TB Control Programme now aims to widen the scope for providing standardized, good quality treatment and diagnostic services to all TB patients in a patient-friendly environment, in whichever health care facility they seek treatment from. The programme has made special provisions to reach marginalized sections of the society, including creating demand for services through specific advocacy, communication and social mobilization activities.

A block-wise analysis reveals that the incidence of TB is high in Thakurpukur-Mahestala, Baruipur, Bhangar-II, Canning-I, Mathurapur-I, Sonarpur blocks. These blocks have to be singled out for specific policy attention.

Box 6.1

Directly Observed Treatment (DOT)

DOT with short course chemotherapy is one of the prime means of treating the TB patients. This system has five components:

- **Political and administrative commitment.** TB is the leading infectious cause of death among adults. TB kills more men than women, yet more women die of TB than all causes associated with childbirth combined. Since TB can be cured and the epidemic reversed, it warrants the topmost priority, which it has been accorded by the Government of India. This priority must be continued and expanded at the state, District and local levels.

- **Good quality diagnosis.** Good quality microscopy allows health workers to see the tubercle bacilli and is essential to identify the infectious patients who need treatment the most.

- **Good quality drugs.** An uninterrupted supply of good quality anti-TB drugs must be available. In the RNTCP, a box of medications for the entire treatment is earmarked for every patient registered, ensuring the availability of the full course of treatment the moment the patient is initiated on treatment. Hence in DOTS, the treatment can never interrupt for lack of medicine.

- **Supervised treatment to ensure the right treatment,** given in the right way. The RNTCP uses the best anti-TB medications available. But unless treatment is made convenient for patients, it will fail. This is why the heart of the DOTS programme is “directly observed treatment” in which a health worker, or another trained person who is not a family member, watches as the patient swallows the anti-TB medicines in their presence.

- **Systematic monitoring and accountability.** The programme is accountable for the outcome of every patient treated. This is done using standard recording and reporting system, and the technique of ‘cohort analysis’. The cure rate and other key indicators are monitored at every level of the health system, and if any area is not meeting expectations, supervision is intensified.

The RNTCP shifts the responsibility for cure from the patient to the health system.

The new Stop TB Strategy published by WHO in 2006 has DOTS in the core with additional components to address TB/HIV and MDR-TB, health system strengthening, involvement of all care providers, engaging people with TB and affected communities, and enabling/promoting research. RNTCP is already implementing/plans to implement the activities recommended under the new Stop TB Strategy.
6.4.4 HIV Control

TB is the most common opportunistic infection in people living with HIV virus. As the HIV breaks down the immune system, HIV-infected people are at greatly increased risk of TB. Without HIV, the lifetime risk of developing TB in TB-infected people is 10%, compared to at least 50% in HIV co-infected. HIV is also the most powerful risk factor for progression from TB infection to TB disease. TB in turn accelerates the progression of HIV to AIDS and shortens the survival of patients with HIV infection. Thus, TB and HIV are closely interlinked.

In India, there are an estimated over 5 million HIV-infected persons. With such large numbers of HIV-positive individuals in India, it is likely that HIV may worsen the TB epidemic in the absence of a robust TB control programme. However, even among HIV-infected people, TB can be cured. Directly Observed Treatment Short-course (DOTS) is as effective among HIV-infected TB patients as among those who are HIV negative.

Official reports of last 2 years as well as sentinel surveillance reports reveal that HIV infection is on the rise in South 24 Parganas. As per sentinel surveillance report 2005, South 24 Parganas had reported the 3rd highest number of HIV cases next to Kolkata and West Midnapur. Similarly the STD cases is also on the rise. The total number of HIV cases officially reported from January to December 2006 is 91. The total number of STD cases reported from January to March 2006 is 16 out 1323 samples tested. A main reason for this is the heavy movement of population in this District. South 24 Parganas is a District having border areas with Bangla Desh, many migrant populations, with many urban areas community up and many resorts and sight seeing spots developed.

A comparative analysis of the data on HIV-positive cases and full blown AIDS cases in the District as on 31.12.2007 reveals their number to be 277 and 150, respectively.

Out of the 91 HIV-positive cases detected in 2006, the highest proportion has been detected in Bangur Hospital and by the CINI unit. The block-wise spread of AIDS is given below.

Source: Office of CMOH
The incidence of HIV+ve/AIDS cases is highest in Bishnupur and Budge Budge municipalities, followed by Sonarpur, Basanti and Magrahat-II. What is concerning to policy makers is the high proportion of children affected – as much as 11.5% of cases reported in 2007 were children.

The National Aids Control Project III financed by IDA, the arm of the World Bank that provides no-interest credits to the most needy countries, is expected to halt and reverse the HIV/AIDS epidemic by 2011, ahead of the 2015 target of the 6th Millennium Development Goal. This project has been implemented from April 2007 and accordingly targeted intervention will be taken to control the rising trend of STD and HIV in South 24 Parganas.

Apart from Government several NGOs...
are also playing crucial role to fight against this deadly disease. War against Tuberculosis has been one of the prime activities of SHIS. It has implemented the DOT program in over 1202 villages of South 24 Parganas.

6.4.5 National Leprosy Eradication Programme

A 100% centrally sponsored National Leprosy Control Programme (NLCP) had been in operation since 1954-55. With the introduction of highly effective MDT for cure of leprosy, the programme was redesignated as National Leprosy Eradication Programme (NLEP) in 1983 with the objective to achieve elimination of leprosy by reducing the caseload to less than one case per 10,000 populations.

The programme received further thrust in 1993-94 when World Bank assisted first National Leprosy Elimination Project was started and the whole country was brought under MDT services with strengthening of existing services, intensive health education, trained manpower development, disability prevention and care including reconstructive surgery. This First NLEP ended on 30th Sept. 2000. The World Bank supported 2nd NLEP started w.e.f year 2001-02 for 3 years, wherein:

1. The NLEP has been decentralized to States/UTs and Districts with responsibilities for planning, implementation, supervision and timely corrective measures.
2. Leprosy services have been integrated with General Health Care System in the country to increase their out reach with extensive community education and involvement.
3. All General Health Care functionaries have been oriented in leprosy (Technical & IEC).

NLEP Simplified Information System has been placed in operation for concurrent monitoring, supervision and timely corrective measures under the programme at different levels of implementation.

Analysis of block-wise figures obtained from CMOH shows a high incidence of leprosy cases in Kakdwip (22), Canning-II (17), Rajpur-Sonarpur Municipality (14) and Mathurapur-II (13). The Health Department must focus on these blocks while implementing the NLEP.

6.4.6 Snake Bites in Sundarbans

Given the low-lying nature of a large part of the District, the incidence of snake bites is traditionally high in South 24 Parganas. Snakebite is a common problem in the Sundarbans and it results in death in many
cases. Even bites from non-poisonous snakes cause trauma, as people do not have information about the features that distinguish poisonous snakes from non-poisonous ones. Every year traditional honey collectors going deep into the forests from February to April face the risk of losing their life to bites by poisonous snakes like the cobra, krait and Russell’s viper. The villagers, especially the women, who are engaged in collection of prawn seed in the rivers and streams/estuaries are also vulnerable to this problem. There have been 8 reported deaths from January-June 2007, compared to 15 in 2006. According to data provided by CMOH, the highest incidence of snakebites in September 2007 was reported from Dwariknagar BPHC (99 cases), followed by Madhavnagar BPHC (45 cases) and Canning SD Hospital (23 cases). Cases of snakebites are also reported from Nalmuri, Falta, Kulpí, Basanti, Gosaba, Sarsuna, Magrahat, Chandi Daulatabad and Sarisha BPHCs, Sonarpur, Joynagar, Amtala, Mathurapur, Raidighi and Sriramkrishna RHs, and Baruipur and Kakdwip SDHs.

Treatment for snake bites is usually done by ojhas. In most cases of snakebite, the affected persons do not receive the correct treatment as anti-venom is not available in the islands. The Sundarban Development Board has launched a year-long programme to impart training to quacks on how to deal with snake-bite cases. The NGO, World Wildlife Fund (WWF), will be collaborating with the Sundarban Development Board in the programme.

6.4.7 Blindness

Apart from eradicating the above-mentioned communicative diseases, another mission of the District to eradicate blindness under the National Programme for Control of Blindness (NPCB). Number of cataract surgeries has increased continuously from 8861 cases in 2004 to 10129 cases in 2005 and the number has crossed 12000 cases in 2006. NGO-Government partnerships are working very well in several blocks of Canning SD, Mandirbazar, Bhangar-I and II.

6.4.8 An Overall Assessment of Endemicity of Diseases

To sum up, while geographically specific problems like arsenic contamination and snakebites still require attention, vector borne diseases and diseases spread through food and water (like diarrhoea) comprise the major health problems in the district. While the government has introduced measures to combat the latter, their success crucially depends upon the socio-economic status of the population. The programmes of the Health Department must therefore be integrated into a multi-dimensional holistic policy to improve literacy (and hence awareness), sanitation and housing facilities and the provisioning of safe drinking water.
6.5 Maternal and Child Health Issues

Maternal and child health is crucial in health care related issues and provisioning of health care facilities. The reason is that both are crucial in determining the health and productivity of future generations. The Government of India has repeatedly taken steps to strengthen maternal and child health services in the country, starting during the First and Second Five-Year Plans (1951–56 and 1956–61) under the Ministry of Health, and continuing with the Minimum Needs Programme initiated during the Fifth Five-Year Plan (1974–79). More recently, efforts to improve maternal and child health have been enhanced by activities of the Family Welfare Programme and by the introduction of the Child Survival and Safe Motherhood Programme (Ministry of Health and Family Welfare, 1992). The Ministry of Health and Family Welfare has also sponsored special projects under the Maternal and Child Health Programme, including the Oral Rehydration Therapy (ORT) programme, the establishment of Regional Institutes of Maternal and Child Health in states where infant mortality rates are high, the Universal Immunization Programme, and the Maternal and Child Health Supplemental Programme within the Postpartum Programme. These programmes are now integrated into the Reproductive and Child Health (RCH) Programme launched in 1996. This new programme seeks to integrate maternal health, child health, and fertility regulation interventions with reproductive health programmes for both women and men.

Maternal and child health services in rural areas of the country are delivered mainly by government-run Primary Health Centres and Sub-centres. Some major issues related to this area are

- Age at marriage including the issue of birth order and birth interval
- Family planning
- Nutrition and the prevalence of anaemia
- Maternal and reproductive health
- Immunisation

The GIS village level map is used to present a snapshot of the situation with respect to child and maternal health. Figure 6.7 shows the spread of Maternity and Child Welfare Centres in the district. It can be seen that in most areas, such centres are absent. Villages in the Sundarban Region do have some Centres (1-4); their number is 7 only in two pockets in Region-II.

The performance of South 24 Parganas is satisfactory with respect to immunization as we have discussed in subsequent section. However, there is considerable room to improve the situation with respect to other parameters relating to child and maternal health. The status of maternal and child health problems in rural areas of South 24 Parganas are rooted in the widely prevalent
Figure 6.7: Number of Maternity and Child Welfare Centers
practice of early marriage, accompanied by high fertility. Contraceptive prevalence is still low in the district, as a result of which birth spacing cannot be practised efficiently by the parents. An analysis of these trends in the district is important to identify the blocks for improving maternal and child health.

### 6.5.1 Age at Marriage

Although there has been a slight decrease in the proportion of girls getting married before attaining the age of 18 years, this
The proportion still remains very high. The Rapid Household Survey undertaken in 2003-04 revealed that about one out of every two girls got married before reaching 18 years (Health on the March, 2005-06). This implies that such women have a **lengthy reproductive span**, leading to very high crude birth rates (CBR). The magnitude of the problem facing policy makers can be seen from the fact that about half of the married women record **3rd or higher order births**. Not only is this rate unacceptably high, but its adverse health implications are compounded by the fact that most of these deliveries do not occur in a safe environment. Less than half of the deliveries occur in an institutional set-up. The incidence of institutional or attended deliveries was only 48 percent in 1998-99; this proportion has decreased alarmingly to 39 percent in 2003-04. As a result of early marriage and pregnancy, the frequency of babies with low birth weight remains quite high.

### 6.5.2 Family Planning in South 24 Parganas

Under RCH programme family planning emphasizes the target-free promotion of contraceptive use among eligible couples, the provision to couples of a choice of contraceptive methods (including condoms, oral pills, IUDs, and male and female sterilization), and the assurance of high-quality care. An important component of the programme is the encouragement of adequate spacing of births, with at least three years between births for ensuring safe motherhood.

Analysis of blockwise data for 2006-07 (Table 6.18) shows that tubectomy is the commonly practised method of sterilization. The number of tubectomy cases is highest in the Sundarban areas – partly reflecting the high population in this area, and partly reflecting the large number of Government schemes targeting this area. Out of the five blocks recording highest number of tubectomy cases, four are in Sundarban region (Kultali, Canning-II, Patharpratima, and Basanti); only Baruipur lies outside the region. This is also true for IUD devices, OP cycles and **Nirodh** pieces distributed.

Examining the prevalence of these methods among male (or female) population, the figures are not very flattering. The performance of blocks in Region-I is also satisfactory and generally better than the blocks situated in Region-II. The latter group of blocks perform better only with respect to oral pills and contraceptive use. The number of medically terminated pregnancies and abortions is the highest in Region-III, followed by Region-II. A blockwise picture of sterilization and other family welfare parameters are presented in Table 6.18.

Table 6.18 also shows that the number of cases of vasectomy is negligible compared to tubectomy cases, mainly due to the presence of government incentives. This indicates that there is scope to develop consciousness and acceptance of vasectomy in all blocks.
### 6.5.3 Pregnancy and Maternal Morbidity

The issue of pregnancy and maternal deaths is related to several aspects like the following:

- Provision of antenatal care (ANC), including at least three antenatal care visits, iron prophylaxis for pregnant and lactating mothers, two doses of tetanus toxoid vaccine,
detection and treatment of anaemia in mothers, and management and referral of high-risk pregnancies

- Encouragement of institutional deliveries or home deliveries assisted by trained health personnel
- Provision of postnatal care, including at least three postnatal visits
- Identification and management of reproductive tract and sexually transmitted infections

In rural areas, a female paramedical worker, called an auxiliary nurse midwife (ANM), is posted at a Sub-centre to provide basic maternal health, child health, and family welfare services to women and children either in their homes or in the health clinic. Her work is overseen by the lady health visitor (LHV) posted at the PHC. With regard to safe motherhood, the ANM is responsible for registering pregnant women, motivating them to obtain antenatal and postnatal care, assessing their health throughout pregnancy and in the postpartum period, and referring women with high-risk pregnancies. The ANM is assisted by a male health worker whose duties include motivating men to participate in the family welfare programme and educating men about reproductive tract and sexually transmitted infections. The ANM and LHV also assist the medical officer at the PHC where health services including antenatal and postnatal care are provided.

Apart from the Government, several NGOs have extended their hands to promote mother and child care activities. One such organization (SHIS) has become popular by working in different villages of South 24 Parganas and focuses on addressing the unmet RCH needs by delivering RCH services, in areas which are under-served or un-served by the government infrastructure. Proposed programme is aimed to enhance male involvement and partnership in improving the reproductive health status of women and children in four blocks of South 24 Parganas, viz. Namkhana, Kakdwip, Patharpratima and Kultali. The intervention also includes adolescent population. The community is mobilized and made more aware of their needs to generate demand for RCH services in the target region.

**Antenatal Check-Ups**: According to RCH programme a pregnant woman should have an antenatal check-up by visiting a doctor or another health professional in a medical facility, receiving a home visit from a health worker, or both. But the surveys regarding this issue reveal that rural areas of the country are far from receiving this type of care in most of the cases.

Two important issues related to antenatal care are **Tetanus Toxoid Vaccination** and **Iron and Folic Acid Supplementation**. An important cause of death in infancy mostly in rural areas of our country is neonatal
tetanus, which is caused by newborn infants becoming infected by tetanus organisms, usually at the umbilical stump. Neonatal tetanus is most common among children who are delivered in unhygienic environments and when unsterilized instruments are used to cut the umbilical cord. Tetanus typically develops during the first or second week of life and is fatal in 70–90 percent of cases. Two doses of tetanus toxoid vaccine given one month apart during early pregnancy are nearly 100 percent effective in preventing tetanus among both newborn infants and their mothers.

Apart from the problem of tetanus, another threat to safe motherhood is nutritional deficiencies often exacerbated during pregnancy because of the additional nutrient requirements. Iron deficiency anaemia is the most common problem in this situation which not only poses threat to the mother but also to the health and survival of infants contributing to low birth weight, lowered resistance to infection, impaired cognitive development, and decreased work capacity. Improvement in a woman’s nutritional status, coupled with proper health care during pregnancy, can substantially increase her child’s birth weight. To this end, the provision of iron and folic acid (IFA) tablets to pregnant women to prevent nutritional anaemia forms an integral part of the safe-motherhood services offered as part of the RCH Programme. The programme recommends that pregnant women should consume 100 tablets of iron and folic acid during pregnancy.

In the absence of data it is not possible to comment on the coverage of pregnant women under the Antenatal Care schemes in different blocks of South 24 Parganas. However, given the early year of marriage and high CBRs, the number of pregnant mothers is likely to be substantially higher than the number of registered cases. This calls for steps to increase the coverage of women under the ANC schemes. Given the mobility of women - from their matrimonial home to maternal homes (during pregnancy) and return to matrimonial homes (after delivery) - it is difficult to keep a track of mothers who have been provided with the required ANC check-ups. The data collection and retrieval system has to be improved to take into account the mobility of expecting mothers.

The available figures presented in the following Table reveal that the percentage of registered mothers completing 3 ANC check-ups is satisfactory only in Budge Budge-I and II, Bishnupur-I and II, Falta, Diamond Harbour-I and II, Magrahat-II and Mathurapur-I and II. The situation has to be improved in the Sundarban area (particularly in Joynagar, Kakdwip and Sagar blocks), and in Sonarpur and Baruipur blocks.

As many as one in five pregnant women
registered for ANC suffer from anemia. This proportion is highest in Region-II (23%), followed by the Sundarban region (21%). In Region-I, this proportion is relatively low, but still at an unacceptable 11%. In 15 blocks of the district, the incidence of anemia among the pregnant women is relatively high. Seven of these blocks are in Region-II (Falta, Diamond Harbour-I and II, Magrahat-I and II, Kulpi, and Mandirbazar), and eight in Region-III (Canning-Joynagar-II, Mathurapur-I and
II, Kultali, Patharpratima, Kakdwip and Namkhana). The proportion is highest in Mathurapur-II and Mandirbazar (above 40% in both cases). This has important consequences for both the mother and child – on one hand it leads to High Risk cases, on the other hand, it increases the possibility of mortality during birth and leads to a high proportion of babies with low birth weight. Community participation is very important in addressing these problems as concern for women, even pregnant women, is not very prevalent in rural areas of our society. The Integrated Child Development Scheme (ICDS) and NGOs have an important role to play in changing attitudes and addressing nutrition-related problems. This has been evaluated in a subsequent section.

**Place of Delivery**

Another important thrust of the Reproductive and Child Health Programme is to encourage deliveries under proper hygienic conditions under the supervision of trained health professionals. Women who receive antenatal check-ups are more likely than other women to deliver in a health facility because their antenatal care providers are likely to have advised them to do so.

The proportion of safe deliveries is quite high throughout the district. Such deliveries include deliveries occurring in medical institutions or home deliveries assisted by Auxiliary Nurse Midwives (ANM). Decomposition of the proportion of safe deliveries reveals that less than half of the babies born are delivered in institutions.

Block-wise analysis shows that only in Diamond Harbour-II, Thakurpukur-Mahestala, Canning-I, Magrahat and Kulpi blocks the proportion of home deliveries exceed 50%. In Bhangar-II, Falta, Bishnupur-I and Bishnupur-II less than one out of every ten babies are born in medical institutions. Out of these four blocks, the proportion of home deliveries assisted by ANMs in Bhangar-II, Bishnupur-I and Bishnupur-II is high so that the proportion of safe deliveries is satisfactory. The situation in Falta is concerning as even the proportion of home deliveries assisted by ANMs is low. Blocks like Baruipur, Sonarpur and Sagar also require the attention of policy makers.

While the proportion of safe births is quite high, the high dependence on home
deliveries assisted by ANMs remains a major area for concern. The reason is that ANMs generally do not reside within their service areas, so that they are not able to provide direct services during delivery.

The Government is attempting to increase the proportion of safe deliveries through the introduction of Janani Suraksha Yojana (JSY) and provisioning of referral transport facilities to poor and under-privileged families under the Rogi Kalyan Samitis at subsidized rates. The allocation under the latter was Rs. 18.85 lakhs in 2006-2007, but the CMOH estimates that a further Rs.35 lakhs is required to meet the targets. ICDS workers may be trained to keep track of pregnant mothers, and facilitate the access to transport services around the expected delivery date. The Ayushmati Scheme aims

Source: Office of CMOH, South 24 Parganas
to provide free of cost emergency obstetric care through empanelled private health facilities under Public – Private Partnership (PPP) scheme to women belonging to BPL and SC/ST families holding JSY cards.

Since traditional birth attendants (Dais) and quack practitioners mostly attend to
home deliveries unattended by trained personnel. To tackle this problem, the Health Department has also attempted to train such traditional birth attendants through various training programmes. However, the trained *dais* may not attend the births. This has resulted in practices like the ‘five cleans’ and other precautionary measures not being adequately taken.

Several NGOs are also playing crucial role in training destitute women, widows, single mother, etc. as a Community Health Worker to stop the problem of unsafe deliveries. SHIS has introduced such training course in Bhangar – I and II, Canning – I and II, Kakdwip, Patharpratima and Namkhana of South 24- Parganas. It provides training to twenty destitute and marginalized women and girls in each block for six months. This trained community health workers, will provided basic health consultation and services to poor communities.

**Postnatal Care**

The health of a mother and her newborn child depends not only on the health care she receives during her pregnancy and delivery, but also on the care she and the infant receive during the first few weeks after delivery. Postpartum check-ups within two months after the delivery are particularly important for births that take place in non-institutional settings. Recognizing the importance of postpartum check-ups, the Reproductive and Child Health Programme recommends three postpartum visits.

The number of recorded maternal deaths is quite low. However, the figures relate to registered pregnancies and may not reflect the actual maternal deaths. In the absence of data on actual pregnancies it is not possible to arrive at any conclusion regarding the actual status of maternal deaths. Most of these deaths occur during delivery; this does not speak well about the health care system in the District. It is necessary to identify to what extent the problem is due to lack of access to health care at the time of delivery and the extent to which the health care system itself may be at fault.

Data from the CMOH shows that maternal death from April 2007 to July 2007 was the highest in Kakdwip (8), followed by Basanti and Mandirbazar (5), out of 71 maternal deaths in South 24 Parganas.

In order to increase awareness about family welfare and maternal health related issues, the District Health Department has taken an initiative to organize Health Camps at the Gram Panchayat level. A record of these camps is given below for the half-year pertaining to 2007.

About one out of every hundred babies
is still born. This has to be lowered still further, particularly in Joynagar II, where one out of every twenty babies is still born. However, it should be noted that the data available with the CMOH may not reflect all the births; in particular, still born babies are likely to be reported less. This means that there may be a downward bias in the estimates of still born babies.

The proportion of underweight babies

</table>
globally acknowledged that investment in human resource development is a prerequisite for economic development of any nation. Early childhood (the first six years) constitutes the most crucial period in life, when the foundations are laid for cognitive, social, emotional, physical/motor development and cumulative lifelong learning. Child survival, growth and development, have to be looked at as a holistic approach, as one cannot be achieved without the others. There have to be balanced linkages between education, health and nutrition for proper development of a child.

Immunization of pregnant women and infants protects children from six vaccine preventable diseases—poliomyelitis, diphtheria, pertussis, tetanus, tuberculosis and measles. These are major preventable causes of child mortality, disability, morbidity and related malnutrition.

Table 6.24 presents data on number of babies immunized. These projects are evaluated by the Health Department using the concept of ELA (Expected Level of Achievement). The ELA figures are, however, ad hoc targets based on a mark-up over last year’s achievements. They do not provide an accurate estimate of the success of the immunization programme. Further the mobility of mothers during pregnancy and after birth (from their matrimonial home to maternal home and back after delivery) creates complications in evaluating Immunization programmes, as babies may receive different doses of DPT and OPV in different places. The Health Department should therefore introduce a Universal Surveillance System based on unique Registration IDs for each mother and her child.

Source: Office of CMOH
In the absence of such data, we have attempted an evaluation based on figures for births provided by the CMOH. These figures indicate the extent of unfinished tasks in the case of immunization. Regional analysis reveals the sharp difference in immunization levels between Region-I and the other two regions. Immunization level in Region-I is substantially higher than the District average. On the other hand, differences in immunization level between Region-II and III is marginal.

Within each region, blockwise variations in immunization level are minimal, particularly in the case of Regions II and III.

6.5.6 Coverage of ICDS

Integrated Child Development Services (ICDS) is a national program committed to the welfare of pregnant/lactating women and children under six years old in India. Funded by UNICEF, ICDS has undertaken pilot projects - under the leadership of the Departments of Women and Child Development & Social Welfare and Panchayat & Rural Development – based on the use of the Positive Deviance (PD) approach in Nutrition and Child Care Program (NCCP) in South 24 Parganas along with several other Districts. Several local NGOs (CINI, ASHA, etc.) have been involved in the implementation of ICDS in such projects. The primary objective of ICDS is to improve the nutritional status of children under three years of age.

The PD informed project has enabled families to break the dependence on donated food, by

- Identifying cheap, locally available nutritious food which some families (PD) feed their healthy children as well as PD caring health-seeking and hygiene practices
- Bringing these food for preparation to the daily NCC session
- Feed their malnourished children a high calorie energy dense extra meal.

Under this initiative, behavioural change is emphasized through participatory learning and community mobilization to bring about the desired results. The guardians of the children bring food including vegetables, fish and eggs to the Anganwadi centre. The ICDS programme provides the centre with rice and pulses. All this is cooked together and a nutritious meal is fed to the children once a day. For twelve days in a month, mothers with undernourished children follow this regime. This is followed up by an 18-day break wherein care givers monitor the feeding practices in the respective child’s homes and record progress. Every month the malnourished child is weighed and in most cases, mothers find their children gaining weight between 100 and 600 grams.
The whole programme is based on an integrated strategy consisting of convergence and partnership through capacity building of childcare functionaries and leaders of the community. This is done through Information Education and Communication activities and dissemination of information about improved methods of child care like breast feeding, immunization and hand washing, community based management of malnutrition through counselling and hands-on child care sessions. The unique feature about the Positive Deviance approach is that it focuses on the inherent strengths of the community and draws from the untapped resources available within the community.

Community mobilization has resulted in the following outcomes:

- Overwhelming positive response from communities in organizing and participating in various collective and creative activities at village level.
- Better relations and cooperation between

diverse communities at village level (Muslims and Hindus).

- Emergence of new leaders and activists at the grassroots level.
- Empowerment of disaffranchised groups: emergence of committed women’s groups, including adolescent girls, to improve childcare practices.
- At ICDS level, healthy competition between Anganwadi Workers (AWWs), increased staff interest, participation and dedication via new monitoring tools and skills, also better accountability to communities.

UNICEF has provided technical assistance as well as partly funding the programme wherever necessary. Progress is monitored right up the chain from the village level to the state level and corrective steps are taken to plug loopholes. Again, the women who used to meet at the Anganwadi Centres have formed self-help groups and in some cases even run income generation programmes. An aggregative picture regarding ICDS activities has been presented in the following Table. It can be seen that there has been an improvement across all parameters.

Table 6.27 provides blockwise data on enrolment of mothers and children. The number of enrolled mothers is high in Canning I, Kulpi and Basanti; the number of enrolled children is also correspondingly high in these blocks along with Baruipur. Thakurpukur-Mahestala block has the lowest enrolment figures. However, it is difficult to evaluate the success of ICDS until we have information on total number of eligible children. The number of deaths, particularly within 0-3 years, still remains high. The number of children aged 0-3 years who have died is high in Canning I, Sagar, Patharpratima, Basanti, Joynagar-I, Canning-II, Bauripur, Mathurapur-I and Kultali (above 80). Statistics indicate that the period of greatest risk is 0-3 years and this age group should therefore be of particular focus in ICDS scheme.

Source: ICDS, South 24 Parganas

Table 6.28 shows blockwise distribution by nutritional status. Since Grade-III and IV children are severely malnourished, they need clinical support and it is difficult to manage them at the community level, ICDS has little role to improve the condition of this category. The only thing the ICDS can do is that it can refer the child to appropriate level and appropriate time. On the other hand, ensuring that normal children remain normal even after six months lies at the heart of the ICDS programme; the window of opportunity for intervention is assumed to be between birth and 17 months of age of the children. Hence the major focus of ICDS is on Grade-I and II children.
(constituting more than 50% of children enrolled under this scheme) as per norms prescribed by World Health Organisation as their needs can be managed at the community level and financial and administrative resources are allocated accordingly.

The blockwise data on nutritional status presented in Table 6.28 shows that the absolute number of Grade I and II children is lowest in Thakurpukur-Mahestala whereas the number is very high in Baruipur, Canning I, Bhangar I, Canning II, Basanti and Kultali. The proportion of Grade I and II undernourished children enrolled under the ICDS is quite high. About one out of every three

children is malnourished in Falta, having the lowest proportion of Grade I and II children. The situation is worst in Joynagar II (where six out of every 10 children suffer from Grade I or II malnutrition), followed by Canning II, Mandirbazar, Joynagar I and Sagar (with marginally lower figures). In as many as 17 blocks, at least half of the children suffer from Grade I or II malnutrition.

The proportion of Grade III and IV children is highest in Patharpratima and Bishnupur II, both in absolute and relative terms. The number of such children in Magrahat I is also very high and exceeds 1500.

6.5.7 Some Remarks on Maternal and Child Health Issues
Issues relating to maternal and child health are of crucial importance in human development. It is necessary to assess the performance of the district health care system in this respect carefully. Unfortunately, as discussed, the data generation and collection system contains major flaws. For instance, instead of looking at actual coverage of babies under immunization, ELA’s are arbitrarily fixed on an ad hoc basis, and performance is measured against these arbitrarily set targets. This provides flawed indications of success to the District level authorities, who are unable to effectively monitor the situation and plan appropriate intervention strategies. We would suggest that a computerized Surveillance system be introduced at the state level based on actual coverage. Based on the data generated, some specific areas requiring urgent attention may be identified. Some of these areas are: safe deliveries, immunization, and ante-natal care. Further, it is necessary to supplement the measures introduced by the Health Department by awareness building programmes. Female literacy campaigns and workshops on maternal health at the school level may be introduced.

6.6 Quality of Drinking Water

6.6.1 Status of Drinking Water
During the last twenty five years there has been an overwhelming development in the field of drinking water supply in West Bengal; 90.28% of the rural population has been covered by Drinking Water Supply System up to 2002 against overall rural population coverage of only 14% in 1977. Rural piped water supply coverage on March 2002 was 24.56% increasing from 0.7% in 1977. The task was not easy in the background of varied hydro-geological conditions in different parts of the state bringing about different qualitative and quantitative problems. Public Health Engineering (PHE) Department is committed to retain this achievement in the field of drinking water supply and to step forward to ensure safe water for all.
6.6.2 Water Pollution

Groundwater, being inexpensive and safe, was used as the main source of drinking water in South 24 Parganas. But during the early phase of 1980s it was detected that some people were suffering from arsenical dermatosis. In 1983 it was observed by the working group of School of Tropical Medicine, Kolkata and All India Institute of Hygiene and Public Health that the samples of groundwater showed presence of Arsenic beyond Maximum Contaminant Level (MCL) of 0.05 mg / l even in some blocks of South 24 Parganas.

A recent study by SOES based on longitudinal data for 19 years has analyzed 8334 hand tubewell water samples from 1374 villages/Para/wards in 79 GP’s/Municipal area from 17 blocks of this District. The Table No. 6.29 shows the distribution of arsenic in tubewell water from South 24 Parganas District. The Table shows that arsenic concentration is above 10 µg/L in 3500 (42%) hand tubewells, above

</tbody>
</table>
50 µg/L in 2359 (28.3%) hand tubewells and above 300µg/L in 547 (6.6%) hand tubewells. From the above analysis, it appears that groundwater in 12 block contains arsenic above WHO guideline value of arsenic in drinking water (10 µg/L) and 11 blocks exceeds Indian standard value for $As$ in drinking water (50 µg/L). Arsenic level above 1000µg/L was found in 30 tubewells. The maximum arsenic contamination level found in this district is 3700µg/L in the Baruipur block. In Diamond Harbour, Gosaba, Joynagar II and Thakurpukur blocks all the tubewells analyzed were arsenic safe (below 10µg/L).

The probable reason may be that these blocks are situated in the coastal belt, so that most of the tubewells draw water from less contaminated deep aquifers. Many blocks such as Kakdwip, Namkhana, Sagar and Mathurapur are very near to the coastal zone so the number of hand tubewells are much less and if at all present they are deep tubewells. Although SOES did not cover these blocks but it can be predicted that tubewells in these blocks will also be arsenic safe.

The figure given below shows the groundwater arsenic contamination status in 17 blocks of South 24 Parganas with the Pie-diagrams indicating the distribution of contamination/safe drinking water.

The Arsenic problem in the District is geo-genic leading to its widespread nature. Therefore the solution was not very easy. With the help of Surface Water based Water Supply Scheme for the Arsenic affected areas of South 24 Parganas 688 villages having 2213 habitations have been fully covered in terms of availability of safe drinking water. Complete eradication of the arsenic contamination, however, calls for active involvement of the affected communities in tackling the problem. However, the Government’s perception of people’s participation seems to be limited to charging a user charge for provisioning of arsenic-free water. The current installation charges are Rs.500 for residential purposes and Rs.3000 for commercial purposes. In addition, a monthly water charge of Rs.30 is charged from households and Rs.50 from commercial units. The amount thus collected is paid into a corpus fund of Rs.325.37 crores invested in 1998-99 by the State Government that will be used for maintaining the system.

Apart from Government, several NGOs are working very efficiently in arsenic mitigation drive in the District. For example, in recent years Ramakrishna Mission Lokasiksha Parishad has taken up Water Quality Surveillance (WQS) activities as one of its integrated development initiatives. As a part of WQS programme, the Parishad is maintaining laboratory units for testing arsenic concentration in hand pump water. The staff members involved in this drive not only collect the water samples and test the same...
but also take lead in motivating people ‘not to use the hand pump water contaminated with arsenic above the permissible limit’ as well as popularising the use of iron-arsenic removal filters. The laboratory unit in the premises of the Parishad is functioning in Baruipur, Sonarpur and Joynagar I blocks of South 24 Parganas.

SHIS is another organization which has taken two approaches for its arsenic mitigation programme:

- Provide an arsenic-free water supply, that is, an alternative to contaminated tubewells.
Provide an arsenic testing technology, that is, to check water from contaminated tubewells.

In many rural areas, there are few alternatives to the contaminated tubewells. As a result, household water treatments (Domestic Filter) are familiar concepts in many parts of West Bengal. SHIS has introduced Arsenic Removal Domestic Filter which follows the concept of the Amal unit, comprises a conventional two-chamber domestic candle filter body, with a layer of activated alumina granules in the top chamber (in place of a ceramic candle filter). The activated alumina media is a granulated form of aluminum oxide that has a strong affinity for dissolved arsenic, and removes it from solution by absorbing arsenic molecules into its surface. The media has a finite absorption capacity, but can be regenerated by flushing with sodium hydroxide and acid. SHIS’s main challenge now is to make this Aresnic Removable Filter affordable, so that we can give some hope of better health for the poor underprivileged.

Another problem of ground water of the District is the presence of excess salinity. Surface water being free from arsenic contamination River Hoogly has been selected as a source. Hence surface water treatment is necessary before supplying through distribution system. Apart from the core scheme, a modern water testing laboratory and an audio-visual auditorium are being set up which would help in maintaining quality of water and also to keep constant vigil over the water supply system spread over a vast area of more than 1100 sq. km.

6.6.3 Coverage of Habitations

PHE Department maintains the data on coverage of villages and habitations in terms of availability of drinking water. A village is said to be fully covered (FC) when
- there is one spot source for 250 persons,
- the villages have drinking water available within a distance of two hundred meters,
- the supply capacity is at least is forty litres per capita per day, and
- quality parameters of drinking water are within specified limits of habitations.

According to PHE, there are about 113 Piped Water Supply Projects currently running in different villages of South 24 Parganas. These projects are taking care of 340 villages covering 959 habitations. Table

Source: Division: Alipore Division, PHE Dte.
The blockwise data on availability of safe drinking water reveals that overall 87% of the habitations are either fully or partly covered. Further it interestingly reveals that Sundarbans region (Region-III) has marginally better coverage - Non Covered area (NC) is 15% - compared to Region-II which is comparatively closer to Kolkata having 15.2% as total NC. Fully covered (FC) as well as partly covered (PC) habitations are highest in Region-I. The block having the lowest coverage in terms of total habitations is Bhangar II having only 37% coverage including PCs along with FCs. Apart from Bhangar II, habitations where more than 30% have remained totally uncovered are in Diamond Harbour I, Canning I and Kakdwip.

Water supply in village schools is another important issue for good hygiene of children as well as to maintain the sanitation system developed in the schools. PHE Department had targeted to cover 1859 number of schools for supplying Hand Bored Tubewells in 2002-03. But 18% of the work is yet to be completed.

However, if we look at cumulative achievement for water supply arrangement in sourceless schools, we obtain a rising trend during the period between 2002 and 2007.

In contrast to the availability of medical facilities, the GIS map for availability of safe drinking water reveals a much better picture. Only the Sundarban Region, in the southern-most area, remains a problem area.

6.6.4 Priority Areas in Provisioning of Water
The overall situation with respect to water supply is concerning. The focus seems to be on ensuring partial coverage – the proportion of fully covered habitations remains poor (only about half of total habitations have been fully covered), and these are more concentrated around Kolkata. Increasing the coverage of villages with drinking water should be a high priority in the district. Further, it should be noted that mere provisioning of water is not enough – the quality of the water is also important. Given the high incidence of water borne diseases (like diarrhoea) and
the spread of arsenic contamination, steps to combat water pollution remain a high priority. The need to provide alternative sources of safe drinking water and the provisioning of arsenic filters at affordable rates are important issues.

### 6.7 Sanitation Facilities

After drinking water, one must consider sanitation which is another vital aspect of infrastructure for achieving the goal of health for all. Epidemiological evidence suggests that sanitation is as effective in preventing disease as improved water supply. According to World Health Organization, the improved water supply and adequate sanitation will result in:

- 25 to 33 per cent reduction in diarrhoeal diseases in the developing world, which accounts for 4 billion cases each year.
- Decreased incidence of intestinal worm infestation (estimated at 10 per cent of the population in developing countries), which leads to malnutrition, anaemia, and retarded growth.

In India poor hygiene and sanitation accounts for 9 per cent of all deaths and an estimated 27,463,000 years of life lost each year (India Infrastructure Report, 2004). According to National Sample Survey data of 1998 for West Bengal, 76.1 percent of households in rural area and 15.2 percent of households in urban area did not have any latrine facility. Though sanitation facilities in urban areas are better than in rural areas, it is far from an ideal situation even in urban areas.

#### 6.7.1 Sanitation Coverage in the District

Coming to District level data in Census 2001, it is found that South 24 Parganas has medium rank regarding the sanitation facilities. The District needs serious work to achieve the goal of complete sanitation on the basis of the fact that even after five years of introducing Total Sanitation Campaign (TSC) the campaign could not sufficiently motivate people of the district on the use of latrine. Apart from the government, several organizations are working to achieve the goal of complete sanitation. Eleven Cluster Organisations of Ramakrishna Mission Lokasiksha Parishad are directly involved in implementation of Total Sanitation Programme in several blocks of South 24 Parganas.

TSC was launched in the District with twin objectives of making the people aware of the advantage of use of sanitary latrines and at the same time providing low cost sanitary latrines to every household. Under the programme the people living below poverty line (BPL) get a subsidy for constructing the latrine, whereas for the above poverty line (APL) households, entire cost of the latrine is to be borne by the owner of the latrine. Table 6.32 shows that only 18% of total target has been achieved for APL households under TSC programme whereas the success rate is 88.6% for BPL households. One of the explanation of such varied success rates may be the arrangement...
Figure 6.14: Availability of Drinking Water

AVAILABILITY OF DRINKING WATER IN SOUTH 24 PARGANAS

LEGEND
- AVAILABLE
- DATA NOT AVAILABLE
- URBAN AREA
- NOT AVAILABLE

2  5  10 miles
of subsidy for the families living below the poverty line. BPL households get a partial contribution of Rs. 250 as reimbursement. It was thought that Campaign will motivate people to construct their own sanitary latrines with technical support from the Sanitary Marts. But the analysis of performance reveals that sanitary latrines were largely constructed only by the BPL families. Although target for construction was marginally higher in the BPL category, performance in the said category (428670) far surpasses the APL category (75472). Hence, one may argue that subsidy is working as the main driving force rather than the awareness aspect which was the core aim of launching TSC.

A blockwise analysis of achievement of sanitation targets (Table 6.33) shows that the success rate varies widely among different blocks. Some of the blocks are very well performing in the district achieving more than 100% of their target whereas some other blocks are very low performing. Namkhana ranks highest in the district, followed by Thakurpukur-

Mahestala, Sonarpur, Gosaba, Kakdwip as second, third, fourth and fifth achievers. The situation is worst in Joynagar II and Canning I, the success rates being only around 30%. Surprisingly, most of the higher rank holders for BPL households belong to Sundarban region. The better inclination towards latrine construction always cannot be explained either by level of educational achievement or by water supply facilities. It needs further study to understand specific dynamics of sanitation activities in the District. It may be the tenacity of the Sanitary Mart, may be the involvement of the Panchayat organizations, or initiative of the Block Development Officer or a combination of these factors that is responsible for higher level of performance in individual blocks.

One point may be worth noting in this context: several gram panchayats have been able to achieve complete sanitation as well as remove any type of environmental hazard in the district. Out of 312 gram panchayats, 11 were awarded Nirmal Gram Puroshkar in 2006; in 2007, 46 have applied for the same prize.

Box 6.3

Provisions of TSC

- Education and Communication for awareness and demand generation
- Incentives for poor to construct individual household latrines
- Sanitation facilities and hygiene education for all types of rural schools
- Baby friendly toilets facilities for Aganawadis
- Community Sanitary complex for poor and landless families.
- Supply chain encompassing alternate delivery

6.7.2 School Sanitation

Schools are important for cognitive, creative and social development of children. So are the School Sanitation and Hygiene Education, necessary for the safe, secure and healthy environment for children.
to learn better and face the challenges of future life. This understanding is very much a part of the policy of Government of India (GoI). From policy to programme, *School Sanitation and Hygiene Education (SSHE)* has now become a reality of school centric development action being realized by most of the schools.

Government is committed to scale up SSHE programme by covering all the government rural schools with drinking water, urinal/toilet facilities and promote health and hygiene activities by the fiscal year 2005-06 with special focus on the girl child. This finds ample prominence in TSC, which encourages construction of school toilets as well as hygiene education in all types of Government schools. The SSHE programme is participatory in nature and an important component of the national reforms programme for rural water and sanitation sector.

Out of 2,468 primary schools in South 24 Parganas where toilets have been constructed so far, 335 schools do not have sanitary latrines, while in 509 there are no latrines for girls. The latter creates problems, particularly for adolescent girls, and may lead to drop-outs.

The fund allotment for sanitization of schools has been summarized in the following Table. It shows that 79% of the work is yet to be completed.

6.7.3 Some Remarks on Sanitation

The District officials have taken steps in improving the situation with respect to sanitation, but there are many unfinished tasks. For instance, the focus of Government programmes is on BPL families. While this was justified given the low coverage of BPL families (only 3% of BPL households had latrines, compared to 36% of APL families), after the inception of TSC programme, a large proportion of BPL families constructed sanitation facilities as they considered it to be an issue related to their social prestige. However the APL families – who are presumed to be more educated and aware – have continued with traditional sanitation practices. Changing behavioural pattern and demand for hygienic sanitation among such families is a high priority area.

6.8 Conclusion

The analysis of the health situation in South 24 Parganas shows that there is scope for considerable improvement in almost all areas. Particular areas of concern are identified as follows:

1. The existing health infrastructure in most blocks does not satisfy existing national norms. This creates a tremendous pressure on blocks where the local population relies on public health facilities. However, such pockets are limited to Sundarbans. In most areas the reliance on public health facilities is much less.

2. The existing three tier referral system does not seem to be functioning effectively in all three regions.

3. The lack of adequate data, particularly on maternal and child related programmes, prevents proper evaluation of such schemes.

4. The proportion of safe deliveries is about 57%. This is quite low; further it hides the fact that institutional deliveries constitute less than a third of recorded deliveries.

5. Only one out of every five registered women completes the three mandatory ANC check-ups.

6. The incidence of anemia among pregnant women is as about 20%. This affects infant mortality and leads to under-weight babies.

7. There is sufficient scope for improvement in performance in respect of immunization.

8. The fact that ICDS is making headway in the district is a welcome sign and can be hoped to reduce the severity of child and maternal malnutrition.
9. There has been rapid progress in the provisioning of safe drinking water. The problem of arsenic contamination has been tackled successfully.

10. The extension of sanitation facilities has been uneven. The record is particularly poor in schools.

Given the inadequate and poorly utilized health infrastructure a significant increase in the expenditure is necessary to meet institutional deficits. The referral system must be made effective through appointment of medical personnel. The reluctance of qualified medical personnel to accept public sector appointments and posting in rural areas is a matter of concern. This is leading to a large vacancy in such staff. Incentives must be offered to attract medical staff. Regular and periodic transfers, residential facilities and greater social status and prestige may be important. The regular availability of staff close to their residence, along with the availability of medicine, is an important pre-requisite in re-vitalizing the referral system, particularly at the Sub-centre level. It may also be necessary to explore how Private-Public Partnerships can be effectively utilized.

Discussions with officials in CMOH indicated that in many areas accessibility to health facilities is a real problem. The introduction of Mobile Health Care Facilities is a welcome step in this regard. Composed of a social worker, paramedical workers and doctor the Mobile Health Team (MHT) visits the project villages periodically to provide support and facilitate development activities. The MHT serves as the liaison between village and health centre. New project villages are visited regularly while growing self-sufficiency, capacity and leadership within the older villages eliminate the need for frequent follow-ups and consultation. The health staff provides primary care for patients who require treatment for minor illnesses and injuries. Patients who have more serious disorders and need testing or more intensive treatment are referred to other hospital-based services, through the Mobile Ambulance facility which is readily available at the time of the clinic.

Mobile Boat Dispensaries aim to provide comprehensive health care services (preventive, promotive and curative) to remote villages, particularly in the inaccessible areas of the Sundarbans. The services provided are OPD, minor surgery, BP examination, X-ray, pathology, ECG, First Aid, Vitamin-A Prophylaxis, treatment of mal-nourished cases and linking up with RCH programme to provide ante-natal/post-natal services, identification of difficult pregnancies and referral for institutional care, immunization, etc.
Apart from health care infrastructure and its accessibility, problems relating to maternal and child health also requires serious attention, particularly in view of their implications for subsequent generations. Major constraints in improving the situation are socio-cultural - the low status of women, lack of education and awareness, early marriage, etc. These problems cannot be solved through a ‘top-bottom’ approach, but requires building community awareness and involvement. NGOs can play an important role in this respect. The ICDS also has a major potential role. Gram panchayats have to be involved more actively.

The scarcity of Female Health Assistants and trained Dais, and their non-availability in the locality on a 24-hour basis are institutional impediments to improving the situation with respect to maternal health. This problem must be addressed by the Health Department. The State Government must also realize the economic importance of health and release financial resources accordingly.

There must also be regular review and evaluation of existing programmes in the area of child and maternal health. Unfortunately, the lack of a Universal Surveillance Data System renders the task of evaluation difficult. This is an institutional reform that should be given high priority by the State. This system should be based on gram panchayats to improve coverage of the data.

We have also constructed a Health Index to assess the overall situation in the District. The average value of Index is only 0.52. This is quite disappointing. The block-wise variation is also minimal.

The highest Index value is obtained by Canning-II (0.70), and the lowest by Gosaba (0.39). It is interesting to note that both these blocks are in the Sundarban regions. The situation with respect to Sundarban blocks is quite varied – four out of the top ten blocks are from this Region. On the other hand, seven out of the last nine blocks are also from this region. In contrast, blocks around Kolkata perform well, except for Budge Budge-II and, to some extent Bishnupur II. The blocks in Region-II, mainly fall in the intermediate stage, though three of them (Magrahant-II and Diamond Harbour I and II) find place in the top ten blocks. This index can serve as a useful tool for geographical targeting and allocation of resources in the district.
Human Security and Vulnerability

7.1 Introduction

The notion of Human Security dominated the development and political agenda during the 1990s in the aftermath of Cold War. Primarily it featured discussions about national security but gradually it narrowed down to consider those pervasive threats that loom large over the “vital core” of people’s life. The “vital core” constitutes what is called the “functioning” of the individuals such as assured basic income, access to food, improved health and security from physical violence. Thus, breaches in Human Security can arise due to exposure to downside risks i.e. risks like economic deprivation, crime and environmental degradation that menace long run sustainability of individuals and interfere with the continuation of daily life and dignity. The extent to which such risk translates into decline of well being determines the vulnerability of humans. Typically development policy dialogues see this vulnerability in terms of “entitlement failure” and talks of enhancing the “capabilities” of individuals by “empowerment” enhancing strategies.

In more than one way the concern over safeguarding human security applies overwhelmingly in case of South 24 Parganas. The district is typically at the lower rung of the ladder in terms of district per capita income compared to other districts of West Bengal (West Bengal Human Development Report, 2004). This place also houses the largest proportion of backward people compared to the state and most of these people depend on traditional agriculture for livelihood support. Along with this, owing to its proximity to the Bay of Bengal, the district often faces the vagaries of extreme climatic events that are mostly hydro-meteorological hazards like cyclones and flood. In fact, in terms of cyclone incidence it ranks first among the ten Indian coastal districts (Ministry of Environment and Forests, 2004). Thus, income shocks are frequent in these areas rendering the populace highly vulnerable.
So far as the crime scenario is concerned the economically weaker group i.e. the women and children suffer the most in this district. West Bengal has the highest share in woman trafficking across all Indian states (National Crime Bureau, 2006) and South 24 Parganas is one of the three districts where such activities are rampant\(^1\).

In South 24 Parganas the percentage of households falling below poverty line (BPL) in rural areas stood at 35 per cent in 2005\(^2\). Compared to the BPL Survey results in 2002 that shows the figure to be around 37 per cent, this is surely an improvement but on relative terms there is a large disparity in the incidence of poverty in the rural and urban areas. The estimated rural and urban poverty ratios in the district are 26.86% and 8.5% respectively (West Bengal Human Development Report, 2004). Hence there is a widespread disparity between rural and urban areas of South 24 Parganas district, in terms of income level. Thus, it is evident that rural areas are poorer and hence more vulnerable compared to their urban counterparts. This chapter would explicitly emphasize on various dimensions of human security with rural population in South 24 Parganas being our unit of analysis. The next section shall only briefly touch upon the economic and social security issues as they are discussed more elaborately in companion chapters. However, one aspect of social security, incidence of crime among the blocks of South 24 Parganas would be discussed in Section III. Section IV will look into vulnerability arising from natural disasters in South 24 Parganas. For gauging vulnerability at the block level, Section V will discuss the vulnerability index and the relative position of the blocks in terms of vulnerability status.

### 7.2 Economic and Social Security Issues

Economic deprivation and poverty are associated with a number of factors like asset position of the households, say, in terms of possession of land and house and occupational status. To demarcate the parameters that would mostly capture the economic and social (in)security we calculate the correlation between various population characteristics for 18 districts of West Bengal (See Table 7.1).

---

\(^1\) The other two districts are North 24 Parganas and Murshidabad.

Source: Own Calculations from Rural Household Survey, 2005, Department of Panchayat and Rural Development, Government of West Bengal.

The table provides a rough sketch of the inter linkages between risky outcomes, vulnerable groups and the private coping measures. As is evident, households employed as agricultural labour and those that live in kuccha houses are positively associated with incidence of poverty. To smooth their income stream agricultural laborers often choose to migrate for casual employment.

In South 24 Parganas agricultural labour force grew in tandem with that of the state as a whole though the growth rate of agricultural labour in South 24 Parganas has been higher (See Figure 7.1). Though not strictly significant yet marginal workers also have a positive association with the extent of poverty. Here, also the district has experienced a slightly higher growth rate of marginal workers compared to the state (See Table 7.2). At the same time, proportion of main workers to total workers has also declined both for the state and district as a whole. The growing distress in employment scenario is also reflected in income status of the district. The per capita income of the district has grown over the years but mostly remained below the corresponding state figure (See Table 7.3, Figure 7.2).

3 Even if statistically non-significant, the positive association between percentage of households working as agricultural labourers and those living in kuccha houses may suggest that there is an overlap between these two groups of people.

</tbody>
</table>

In fact our own calculations showed that the compound growth rate of South 24 Parganas (5%) has been slightly lower than that of West Bengal (6%) from 1997-98 to 2004-05 (See Table 7.4). Going by district per capita incomes, the rank of South 24 Parganas in 2000-01 was 14 among 18 districts. The rank was 6 in 1980-81 (West Bengal Human Development Report, 2004). Hence the comparative position of South 24 Parganas in the State is not at all impressive and even more alarming is the fact that its relative position has deteriorated over time (See Table 7.4).
People with low income lack the capability to achieve secure shelter for residence and so it may be interesting to observe the pattern of dwelling possession in South 24 Parganas. Census 2001 has divided the households according to the condition of houses. These categories are “Good”, “Livable” and “Dilapidated” houses. From Table 7.4, it is clear that the conditions of households in South 24 Parganas are more or less similar to the condition of the State. But it is alarming that about 60% households in South 24 Parganas are not living in ‘good’ houses.

The condition/status of houses can also be classified into four categories: Permanent, Semi-Permanent, Temporary Serviceable and Temporary Non-Serviceable. The number of permanent households considerably increased from 1991 to 2001 and the increase was greater in the district compared to the overall state figures (Table 7.6).

Source: Census 2001
The foregoing discussion clearly demonstrates that the district has recorded some improvements in matters of housing. On the other hand, it has generally lagged behind so far as employment and income generation is concerned thereby making the resident households more prone to economic and social shocks. In this context the social safety nets provided through institutional arrangements could be one crucial determinant of vulnerability. Here we discuss the performance of district for six major schemes: a) National Old Age Pension Scheme (NOAPS) b) National Family Benefit Scheme (NFBS) c) Sampoorna Gramin Rojgar Yojana (SGRY) that was subsequently replaced by National Rural Employment Gurantee Act (NREGA) from 2nd February 2006, d) Swarnajayanti Gram Swarojgar Yojana (SGSY) and e) Indira Awas Yojana (IAY).

Both NOAPS and NFBS function under the National Social Assistance Programme (NSAP). Primarily designed for ensuring subsistence to destitute persons above 65 years of age. NOAPS provides a monthly pension of Rs. 400. On the other hand, NFBS provides one-time financial assistance of Rs. 10,000/- to poor families that have lost their principal earning members. So far as utilization is concerned South 24 Parganas have performed well with respect to the overall performance of the state (See Figure 7.3). However, its performance somewhat dropped down in 2004-2005 in regard to NFBS and in fact it had the lowest number of beneficiaries among the nineteen districts of state in 2004-05 (Annual Report 2004-05, Department of Panchayat and Rural Development, Government of West Bengal).4

The SGRY was intended to provide wage based employment to agricultural workers mainly during the lean season. Its successor, NREGA, that was later introduced in ten districts including South 24 Parganas expanded the approach and in

---

4 The records show that only six families out of every hundred thousand families benefited under the NFBS scheme in South 24 Parganas.
addition to employment generation emphasises on awareness about the right to get employed. NREGA now extends to all the districts. However, the performance of the district both in terms of coverage of the scheme and the number of person-days generated is dismal (See Table 7.7).

**Figure 7.3: Percentage Utilisation of National Social Assistance Funds**

Source: Office of the District Magistrate, South 24 Parganas

Both in terms of number of registered households in NREGA and average expenditure per Gram Panchayat South 24 Parganas ranks last among the ten participating districts. Apart from that the average number of person-days generated...
under the programme is among the third lowest in the district. The SGSY scheme is designed to generate self employment among the rural poor by organizing them into self help groups. SGSY is funded by both Central and State Governments in the ratio 75:25. In this case also the performance of the district is poorer than the average over the districts. Particularly notable is the neglect of woman and scheduled tribes from the ambit of the scheme (Table 7.8).

In summary the social assistance programmes related to employment generation and poverty alleviation did not perform satisfactorily in recent times. The weaker groups like women and scheduled tribes received relatively lesser coverage under the schemes of self employment having adverse implications for their vulnerability status.

Lastly, one may look into the IAY scheme that provides shelter to the rural households lying below the poverty line. Programmewise this is the most successful one in South 24 Parganas as in West Bengal (See Figure 7.4).

Source: Office of the District Magistrate, South 24 Parganas

5 On the whole, the performance of NREGA has been poor in West Bengal. Although, the number of registered households for employment assistance is substantial, on an average only 14 days of employment could be generated per household during 2006-07.

6 The targets for the IAY scheme is the number of households that are planned to get assistance under the programme. This is set according to caste, disability and other criterions for women like widow, war widow and unmarried woman.
For both 2004-05 and 2006-07 South 24 Parganas have not only exceeded the state figure but also bypassed the target set under the IAY scheme especially in 2006-07. This is perfectly commensurate with improved conditions of dwellings prevailing in the district.

7.3 Crime and Violence

In terms of IPC Crime rates West Bengal had a fairly good position vis-à-vis the national average in 2006. For both overall crime rates and violent crime rates West Bengal had the fourth lowest figure among the 32 states in the country (National Crime Records Bureau, 2006) thus maintaining the position it had in 2000 (West Bengal Human Development Report, 2004)\(^7\). Unfortunately its record in crime relating to women trafficking is the worst and in 2006 out of 123 cases of girls sold for prostitution in the country 114 had hailed from this state (National Crime Records Bureau, 2006). Along with Murshidabad and North 24 Parganas, South 24 Parganas is identified as one of the major areas where such illegal trafficking takes place.

In fact, so far as crime against women (CAW) is concerned South 24 Parganas had a remarkably high share in the State. According to Indian Penal Code (IPC) crimes against women can be classified as:

- Rape (Sec 376 IPC)
- Kidnapping and Abduction for different purposes (Sec 363-373 IPC)
- Homicide for Dowry, Dowry deaths or their attempts (Sec 302/304B IPC)
- Torture /cruelty both physical and mental (Sec 498A IPC)
- Molestation (Sec 354 IPC)
- Sexual Harassment /Eve-Teasing (Sec 509 or 294 IPC)
- Importation of girls up to 21 years of age (Sec 366B IPC)

The composition of crimes in the state as well as in the district is biased towards post marital violence accounting for more than half of the total crimes in 2002. In terms of share of the total CAW in the state South 24 Parganas takes the lead among all 18 districts in 2000 and 2003 (Table 7.9). The relative position of women got worse as its share in total IPC CAW increased between these two time periods.

\(^7\) The overall IPC crime rate in West Bengal stood at 79 compared to the all India average of 167.7 while for violent crime, the figure is 12.1 as against the country average of 18.4. However one distressing fact is that while the average cognizable crime rate in India dropped from 172.3 it actually increased in case of West Bengal from 76.7 in 2001 (National Crime Record Bureau, 2001).

Source: National Women Commission
Figures in parentheses show percentages of each category of crime to total crime for the year year.

So far as different components of CAW are concerned the share of South 24 Parganas in cases of torture etc. was the highest in the state accounting for about 15 per cent of all cases. Its share in dowry related deaths was very low in 1995 but took a sudden spurt in 2000 and 2003 and once again remained the highest among districts. Given the fact that female literacy rate in the district is lower than the state average (62 per cent) and most of the women headed households are employed as marginal workers (Table 7.1) the high rate of crimes impart adverse implication for the vulnerability status of women.

A more reliable estimate of exposure to internal violence is given by the crime rate and here also the district has the second highest crime rate in 2000 and the highest in 20038 (See Figure 7.5).

8 Crime rate is defined as number of crime committed per lakh population. For the year 2000 we have taken census 2001 population and the projected population for 2003 is calculated assuming an annual growth rate of 2 per cent.
Within South 24 Parganas there is marked interregional variation in overall crime rates as well as in rates of CAW. For brevity we have decomposed the overall crime incidence into three groups. The first is violent crimes consisting of dacoity, robbery, burglary, theft, murder and culpable homicide. The other two categories are riots and crime against woman. Taking the average values of the total incidence of crime over three years from 2005 to 2007 it is seen that on an average violent crimes decreases as we move away from Kolkata but the incidence of CAW and riots increase significantly (Table 7.10).

On an average, the region closer to Kolkata has a higher crime rate followed by

Figure 7.6: Trends in Crime Rates in different Regions of South 24 Parganas
by the North East and Mid West region and then by the Sundarbans cluster. Of course, Figure 7.6 must be interpreted with some caution as there is a high possibility of underreporting of crimes in remote areas like Sundarbans.

CAW have highest incidence in Sundarbans while the other two regions have experienced almost equal proportions of such crimes in last three years (Figure 7.7). For riots the highest incidence is in Sundarbans area followed by the North East and Mid West and the incidence is the least in Kolkata surroundings (Figure 7.8). Blockwise Thakurpukur - Maheshtala and Sonarpur in Region-I, Bhangar in Region-II and Canning in Region-III are most crime prone for all the three types of crime reported (Table 7.11)\(^9\).

\(^9\)Data on incidence of crime is provided at Police Station level and in some cases two different blocks came under the jurisdictions of the same Police Stations. Thus in some cases we had to merge two blocks like Bishnupur, Bhangar, Canning and Joynagar in Table 7.11.

Note: Violent crimes include dacoity, theft, robbery, burglary, murder and culpable homicide.

7.4 Vulnerability to Natural Disasters

Natural disasters, especially hydrometeorological hazards like cyclones and storm surges frequently occur in South 24 Parganas. The southern part of the district comprising the Sundarbans mostly bears the brunt of such disasters and hence we shall largely limit the discussion of this chapter to the 13 blocks of Sundarbans in South 24 Parganas.

The stretch of Indian Sundarbans extends over an area of 9360 sq km comprising 102 islands of which 52 have human settlements\(^\text{10}\). When early settlement began in the area in 1770 (Bhattacharya, 1990)

\(^\text{10}\) The geographical span of Indian Sundarbans is divided in 19 administrative blocks of which 13 falls under the South 24 Parganas district and the remaining 6 falls in the district of North 24 Parganas.
it was immediately recognized that economic activity in the area faces the risk of tidal inundation from the complex network of the river system interspersing the area. Moreover, as it lies in the apex of Bay of Bengal tropical depressions leading to cyclones and storms occurred frequently. Thus, apart from the damage risk of cyclonic wind, storm induced wave surges causing tidal floods were another potent disaster the local people had to cope with. To avoid the damage cost from these hazards, mud embankments called the “circuit embankments” around 3500 sq km of area were constructed and till date this remains the first line of defence against insurgence of tidal waves.

A much talked about disaster in recent years was the "surge effect" caused by heavy rains and storms. This phenomenon led to severe flooding and damage to infrastructure.

Figure 7.9: Vulnerability Profile (Flood and Cyclone Hazard Map) of South 24 Parganas as per Official Estimate

11 The main rivers in this area including the estuarine and all having a southward course towards the sea are the Hugli, Piyali-Bidyadhari, Muriganga, Saptamukhi, Thakuran, Matla, Gosaba and Haribanga. The Sundarban delta experiences two flow (inflow) tides and two ebb (outflow) tides during 24 hours. The tidal range varies from 3m to 5m and may rise up to 8m during normal spring tide.

12 Analyzing the records of incidence of tropical cyclones in Sundarbans from 1582 to 1994 one finds that on an average cyclonic depression hits the area every two to three years.
times is of course the coastal erosion induced submergence of islands, especially in the Sagar Block. The tidal movement has already engulfed two islands, Lohachara and Suparibhanga and it is gradually eroding away the Ghoramara Island in the Sagar Block. According to Ghosh et.al. (2003) the island has already lost 75 per cent of its land in the past 30 years with the refugees moving away to adjacent islands like Kakdwip. An estimate by School of Oceanographic Studies, Jadavpur University, predicts that at the present rate of erosion almost 30,000 people will be displaced from Sagar and another 20,000 from Namkhana by 2020. Several other islands in the western estuarine delta including Ghoramara will be completely deserted (Priyadarshini, 2006).

Keeping in mind the fact that the region is lagging behind in terms of basic human development indicators like health and education and that women and children are also less secure it is obvious that coping ability of the inhabitants in these areas are minimal and hence they are highly vulnerable to such hazards.

According to official estimate the vulnerability from natural disasters like flood and cyclone is extremely severe in 7 out of 13 blocks in Sundarban area falling under South 24 Parganas (See Figure 7.9).

The ranking criteria are however largely guided by past risk exposure evidence (Table 7.12) without taking into account the adaptive capacity of the communities that depends on a host of factors like ex-ante mitigation works of the government and coping abilities of settlers, which in turn is contingent on countless social and economic factors like income and awareness level.

Risks from natural disasters in Sundarban can be broadly classified into two types depending on the scale of occurrence: regular idiosyncratic risks occurring from embankment collapse and systematic risk occurring from the cyclones and storm surges that are low probability high consequence events.

Embankments raised along the river bed are the most vital “public defence” that are supposed to protect the people from not only extreme events of tidal surges but also from the flow tide and ebb tide that takes place every 24 hours in the area. During the months of April to October the tidal waves assume giant proportions and causes breach in the mud dykes. This is especially detrimental for paddy cultivation as the tidal ingress raises the salinity of the soil until a couple of monsoon rains completely washes away the salt deposition from the field. In most cases gushing flow of saline water also causes considerable damage to physical assets and livestock. Thus, maintenance of embankments and their
### Table 7.12: Recent History of Disasters in South 24 Parganas

</tbody>
</table>
timely repair is synonymous to maintaining a smooth income stream of the people.

Under the colonial rule the Zamindars, who encroached the land, looked after the maintenance of the dykes. But with the abolition of the Zamindari System the onus of repair and surveillance of the mud embankments lay solely with the Department of Irrigation and Waterways (DIW), Government of West Bengal. Government response to the exigency are of two types: (i) ex-ante mitigation, involving maintenance of embankments and in times of adverse weather, dissemination of warning messages and evacuation, and (ii) ex-post coping in terms of repair of breached embankments and allocation of relief to the affected villagers.

According to the DIW there are two major causes of embankment damage in the Sundarbans area. Technologically the embankment structures are weak since they were initially built out of uncohesive silt available on the upper layer of riverside that cannot resist the tidal surges in the long run. Also, unplanned settlement even in concave sides of the bends of the meandering river necessitated construction of embankments that were highly unstable due to natural scouring away of underneath river silt that gradually weakened its base. Secondly, embankment damage is also linked with the proper drainage through sluice gates in these areas. The average annual rainfall in the area is 1625 mms (65 inches). The area is flat with a silty clay soil and so there is little ground water absorption. To protect the crops from inundation sluice gates have been placed in these areas that drain away the water to the adjoining rivers and canals. However, they are largely inadequate as they serve only 0.119 million hectares (460 sq. miles) of land out of 0.259 hectares million hectares of land. As rainwater accumulates in the crop fields, people make crude cuts on the embankments for draining away the water. These unauthorized cuts are seldom closed to proper sections thereby making the embankments vulnerable to tidal surges and wave action.

Apart from hydro-meteorological causes large-scale conversion of paddy fields to brackish aquaculture is yet another threat to the structural stability of the existing system of embankments. Conversion of paddy fields into brackish aquaculture is a steadily growing practice in Sundarbans. As a part of the process the Bheri (fishery) owner initially acquires land from large

---

13 Initially the land was parcelled out in ‘lots’ to the affluent people who brought in tribal people called ‘Chakdars’ to begin clearing and cultivation in the area. Knowing that the island inundates during high tides twice a day the stretch of mud embankments was constructed by these ‘lot-holders’ and was commonly hailed as Zamindari Bandhs (Bandopadhyay, 2000).

14 Status report on the progress of “Urgent Repair works in Sundarbans” in 2006, Department of Irrigation and Waterways.

15 Chopra, Kumar and Khan (2007) find that declining land productivity and increasing population density is the determining factor for the conversion of agricultural lands to aquaculture in Indian Sundarbans.
landholders for a lease\textsuperscript{16}. To ensure inflow of saline water they dig channels in embankments that reportedly increase the chance of embankment failure during high tides. The water inlets are completely illegal, as The Bengal Embankment Acts of 1876 and 1882 require that any alteration of the existing embankments should be notified to the Collector for approval\textsuperscript{17}. The spread of these inland fisheries also raises the demand for wild prawn seeds as the supply from the hatcheries is not adequate. The supply of the prawn seeds, called Meen in local parlance, comes from informal seed collectors who wade through the river banks. Apart from adverse health consequences, the process also weakens the embankments as the seed collectors trample upon the mud base and aggravate soil erosion. Thus, damage risk of the existing embankments is multidimensional and vulnerability of the victimized populace is likely to be different depending on whether the embankment breach is from natural and/or anthropogenic factors.

Officially 9 out of 13 blocks of Sundarbans in the South 24 Parganas district have been identified to have potentially weak embankments due to natural shocks and fishery problems (Table 7.13).

Among the vulnerable blocks the conditions of Basanti, Gosaba, Mathurapur-II and Patharpratima are fast deteriorating (Table 7.13)\textsuperscript{18}. Maintenance of embankments requires huge capital expenditure the fund comes from three sources: Calamity Relief fund (CRF) from the Central Government, allocation of the State Government for Disaster Management and the own fund of DIW. The expenditure on embankments has a rising trend though it petered out in last five years (Figure 7.10).

Source: Disaster Preparedness & Response Plan-2002, South 24 Parganas, Government of West Bengal

\textsuperscript{16} Field visits conducted in villages of Basanti and Gosaba revealed that Bheri owners pay on an average Rs. 3000 to Rs.3500 per bigha annually to the landholders for leasing out their land. After tax deductions net income from leased out land comes around Rs.2500/bigha per year.

\textsuperscript{17} For a discussion of flood control laws in India see Kamta Prasad (2006).

\textsuperscript{18} Having said this it must be kept in mind that without a sufficiently large time series inference about the growth in breach would surely involve a large margin of error. Thus, while several areas in Namkhana like Patibonia and Dhoblaat in Sagar are highly vulnerable to tidal surges aggregation at the block level in fact show a declining trend in embankment breach. With limited observation and large level of aggregation the vulnerability from embankment damage must be understood with caution.

† Figures in parentheses show percentage breach out of total length of embankments in the Block.
Source: Department of Irrigation and Waterways, GoWB
While the general consensus is unambiguous about the natural causes of embankment damage, the opinion is divided about whether human activities like fishery or cutting through embankments to drain out rainwater are significant determinants of breaches. Interactions with local people and people of the Sundarban Development Board repeatedly gave rise to the concern that unregulated fishery activities are one of the many causes of embankment failure in Sundarbans. On the other hand, promoting brackish water aquaculture is an important livelihood strategy undertaken by the Government in these areas. This involves bank credit and so economic consideration may point towards a diametrically opposite thing: people whose payback is contingent on the stability of the embankments would rather look after their maintenance purely for private benefit that can convey a positive externality on the neighborhood residents. It seems that what matters here is the institutional arrangement under which fishery is organized. If it is largely informal then the fishery owner flouts the norms for setting up the fishery and so will try and maximize his short run gain. Thus,

**BOX 7.1 : Embankment Collapse and Community Action**

The Mousuni Gram Panchayat in Namkhana Block is known to be vulnerable for frequent collapse of embankment stretches. In one such incident in May 2003 the embankment breached in Kusumtala close to the mouza boundary of Baliara engulfing among other things the unpaved road that leads to a primary school near the river. Children were kept from attending the school which also meant they would not get the supply of mid day meals that supplemented their diet to a large extent. When mothers complained about the incident to the Panchayats they advised them to go for mending the road on their own. As the Namkhana Panchayat Samiti was of a different political orientation so they feared that sanction for public works would be delayed. The women folk under a Self Help Group decided that male members of the community would do the work and they would cook for them in temporary camps on the road side. However, the day when the work would start no male member turned up and finally the women decided to carry out the work on their own. They completed the work in four days engaging 118 labour hours. Though this could stand as an example of community involvement in risk coping, it also shows the delayed reaction that could as well prolong the burden of damage cost among politically fragmented rural self governments.

---

19 According to official sources the average per hectare yield is 900 kg for aquaculture farms. Some preconditions for setting up the fisheries include: a) a minimum distance of 200-300 meters from the shoreline (though coastal zone regulations require a minimum distance of 500m from coastal line for any economic activity to take place) b) registration from the aquaculture authority and permission of the Environment Department and c) the entrepreneur must have at least two hectares of land at their disposal.
little attention will be paid towards mitigation of breach events and maintenance of embankments. So far as breaches due to unauthorized cuts for draining out rainwater is concerned the counter-argument goes that it occurs only in a few places and that its frequency of occurrence over the years is very low.

Whatever may be the cause, the rising difficulty of embankment maintenance is highlighted from the fact that mitigation expenditures have increased over the years but have failed to arrest the breach and the resultant damage significantly. One important drawback that thwarts collective action for risk coping at the community level is the possibility of coordination failure across the different tiers of the Panchayats (See Box 7.1).

Naturally, the question arises whether the community organizes itself to pool indigenous resources for maintaining the embankments and to minimize the cost of tidal ingress. Surprisingly, it is seen that no such efforts exist among the people in Sundarbans. Those who get displaced by tidal floods again settle on the raised platform of embankments knowing fully well that they may have to relocate shortly when the next tide occurs. Here, intra block relocation of households is the chosen coping strategy rather than expending resources on mitigation.

Historically, however, settlement in these areas did not follow the pattern followed in Bangladesh part of Sundarbans where there were large scale private initiatives to raise and maintain embankments. When reclamation of Bangladesh Sundarbans was nearly complete in 1904 barely 40 per cent of the South 24 Parganas Sundarbans had human settlements (Ascoli, 1920). It was understood that the required scale of investment to raise embankments in these areas would be far greater than the private benefit accruing from agricultural activities due to the frequency of extreme weather events. Hence to encourage settlements active governmental support in the form of reclamation loans and embankment construction were extended. Thus, collective action in the form of a tradition in these areas is largely absent. Moreover, the alienation of the local people as an agent of management of local resources

---

20 In areas where there are brackish water farms near the river embankments, farm owners commit some money for embankment maintenance every year on a regular basis. This is because except in times of dire emergency Department of Irrigation and Waterways are reluctant to carry out mud patching in these areas. They reason that since the fishery farm owners carry out their business by digging channels in the embankment structure it’s also their responsibility to maintain it. In a way this has encouraged a lot of private effort towards provisioning of flood defense in form of embankment maintenance. In Sundarbans two types of public effort is present: individual maintenance expenditure and collective expenditure on embankment maintenance through committees involving fishery owners. In South 24 Parganas part of Sundarbans the former type of arrangement is mostly seen while collective maintenance through activities is largely present in North 24 Parganas part of Sundarbans like Sandeshkhali-I and II.
like embankments by delegating the responsibility to decentralized institutions like Panchayats might have also triggered such inaction\textsuperscript{21,22}.

Finally, for co-variate risks like tropical depressions and cyclones one important problem in the district is the lack of adequate Cyclone Warning Message Centres (CWMC) and the complete absence of cyclone shelters. Among the seven extremely vulnerable blocks only Basanti, Namkhana and Kakdwip have early warning systems. One study about information gaps in the Sundarbans revealed that fishermen generally depend on Bangladesh radio for warning messages as there have been cases when the warning messages from All India Radio (AIR) reached them after the disaster has struck\textsuperscript{23}.

\section*{7.5 Towards a Block Vulnerability Profile: Vulnerability Index}

The official estimate of vulnerability has one important drawback in the sense that it solely relies on historical risk exposure data to assess the susceptibility of damage to disaster shock. The assessment is not complete in the sense that it does not take into account the adaptive capacity of the community that is governed by their entitlement reflected by asset position and the extent of empowerment that can be obtained from indicators like education, health and social security that the people can avail of. Thus, given the same level of risk exposure the community with higher adaptive capacity is less likely to be vulnerable. To account for that, a vulnerability index is constructed as a composite of two indices: Economic and Social Vulnerability Index (ECVI) and Bio-Physical Vulnerability Index (BPVI). The ECVI is constructed by choosing deprivation measures from the Rural Household Survey (RHS) data with the idea that communities having lower level of deprivation are more capable of adapting to extreme events than those with higher level of deprivation. The RHS provides categorical (percentage of households) data on the following 8 indicators:

\begin{itemize}
\item a) Possessions of land
\item b) possessions of house
\item c) clothing
\item d) food intake
\item e) earning members
\item f) literacy
\item g) \end{itemize}

\textsuperscript{21} Interaction with people in Sundarbans during field visits clearly revealed that earlier family members actively patched damaged embankments with mud before and during the occurrence of breach. But gradually the decision making process regarding embankment maintenance slipped away from them and they now complain of untimely and inadequate repair works that they think is caused by the chain DIW-Panchayat-Contractors operating in those areas.

\textsuperscript{22} In recent times mud patching of the embankments is being carried out through the NREGA programme. In fact for most of the villages one of the most important sources of employment delegating people for strengthening the embankments. Though people are critical about the allocation of NREGA funds there is a general consensus that the state of embankments has improved after the introduction of NREGA.

indebtedness, and h) migration. For the ECVI we standardized the indicators as follows

\[ \frac{x_{ij} - x_{ij}^{\text{min}}}{x_{ij}^{\text{max}} - x_{ij}^{\text{min}}} \]

Here, \( x_{ij} \) is the \( i^{th} \) indicator for the \( j^{th} \) block and \( x_{ij}^{\text{max}} \) and \( x_{ij}^{\text{min}} \) are the maximum and the minimum values of a particular indicator across blocks with \( i=1,2,..,8 \) and \( j=1,2,...,29 \). Then the standardized indicators are combined by computing a simple average for each block to obtain the ECVI. Here, we have attached equal weight to each factor. By way of construction higher values of ECVI would denote higher vulnerability and thus is assigned a higher rank. The ECVI shows that regionwise Sundarbans has the lowest adaptive capacity and given the preponderance of natural disasters, naturally more vulnerable than the other two regions (Table 7.15). It is clearly seen Budge Budge-II in Region-I, Kulpi in Region-II and Basanti in Region-III are most vulnerable blocks so far as adaptive capacity is concerned.

</tbody>
</table>
The next task is to arrive at an aggregate index combining both ECVI and BPVI. The BPVI is derived from the estimate of the population likely to be affected by the natural disasters out of the total population in each block (Disaster Preparedness & Response Plan-2002, South 24 Parganas, Government of West Bengal). Here we require an ordinal aggregator and towards this end the Borda Rule as a method of rank-order scoring suggests itself. Going by it we first rank each of the standardized measures of deprivation that we obtained from the RHS of South 24 Parganas. Adding up the ranks gives us the Borda Score of economic and social vulnerability. Then we rank the blocks according to the percentage of the population that are likely to be affected from natural disasters using the earlier standardization method (Table 7.16).

Finally, we add up the ranks of the BPVI with the Borda Score of the economic and social indicators to arrive at the aggregate Borda Score and rank the blocks according to the score obtained (See Table 7.17).

</table>

Note:
H: Percentage of households with no house
G: Percentage of households with number of garments less than 2
F: Percentage of households that can manage less than 1 square meal a day for the major part of the year
EDU: Percentage of households where all 7+ members are illiterate
EARN: Percentage of households having no regular wage earner or consisting of women, infirm, old or children only
D: Percentage of households that have to take loans from familiar persons for everyday needs
M: Percentage of households that have to migrate for various reasons to earn livelihood
L: Percentage of households with no land holdings

BSESI: Borda Score based on the ranks of Economic and Social indicators
BSPLA: Borda Score based on population likely to be affected from Natural Disasters
The composite Vulnerability Index (VI) preserves the ranking of ECVI and EI in the sense that here also the Sundarban region is most vulnerable followed by Region II and Region I (Figure 7.11). Moreover the rank correlation between the BSESI and BSPLA is positive and significant at the level of 10 percent. Taking Sundarbans in isolation it is found that in terms of Composite Vulnerability Index Basanti and Pathapratima are the most vulnerable among the 13 blocks (Table 7.18).

It is absolutely necessary, however, to keep in mind the possible causality between economic and social vulnerability and exposure to climatic hazards. Poorer people tend to settle in risky areas and hence are more exposed to natural disasters. On the other hand disaster driven income shocks can be the sole determinant of poverty and vulnerability.
In terms of overall vulnerability this exercise conforms partially to official assessment in that Basanti and Patharpratima display high vulnerability. But unlike official estimates Gosaba and Sagar display lesser vulnerability and herein lies the role of economic and social factors that determine adaptive capacity of the communities. For instance in terms of asset position Gosaba and Sagar fare well compared to their counterparts in Sundarbans as here the percentages of landless households are very small. In addition, Sagar Block displays lesser indebtedness and higher levels of literacy that can be suggestive of better capacity to cope with natural hazards. On another note tourism benefits from Sagar Mela might have prompted better maintenance of infrastructure in Sagar Block thereby moderating the damage potential of climatic shocks.

7.6 Concluding Observations

Employment generation strategies have not worked well in South 24 Parganas – number of mandays generated is the third lowest among the districts. Given the low per capita income and the highest concentration of backward classes in the district this implies low levels of economic security. However, its performance in housing schemes is better.

Social security for women is severely lacking as crime rate against women is the highest in the district. Incidence of Riots and CAW outnumbers the violent crimes in the district and these two types of crimes multiply as one moves from regions near Kolkata towards south in Sundarbans. In terms of crime rates for violent crimes, CAW and riots, Thakurpukur-Maheshtala and Sonarpur in Region-I, Bhangar in Region-II and Canning in Region-III are most vulnerable.

Idiosyncratic risks arising from embankment damages are on the rise despite huge mitigation expenditures. Conditions of Basanti and Gosaba are fast deteriorating. Apart from natural causes unorganized fishery activities are supposed to be the prime drivers of embankment breaches. Community institutions for collectively managing embankments are missing in Sundarbans raising question marks regarding operation of decentralized Panchayati Raj bodies.

Finally, in terms of Economic and Social Vulnerability Budge Budge-I, Kulpi and Barasia come out as the most vulnerable blocks in South 24 Parganas. But in terms of overall vulnerability Basanti, Kultali, Joynagar-I and Patharpratima occupies last four positions among the 29 blocks.
Until now, the primary concern has been with the issues relating to overall human development in the district of South 24 Parganas. To assess the causes and remedies thereafter, in respect of decline in quality of life (QOL), the issue of vulnerability has also been dealt with. In the journey traversed so far, we have devoted ourselves to a somewhat broader analysis of overall economic well-being, paying very little, if at all any, attention to social inequality. While such inequality, it may be emphasized at this stage, may have various dimensions such as area of residence, religion, race, social community, gender etc, development theoreticians consider gender as the most important one. For a fuller treatment of HDR of South 24 Parganas, one therefore, makes an attempt in this chapter to examine the extent to which the fruits of human development are being enjoyed equally by both genders and identifies the areas revealing gender disparities, for proper policy interventions.

This chapter attempts to highlight three major facets of gender and development in the district. (1) After a brief overview of the history of ‘Gender and Development’, we take up the issues related to gender disparity in human development viz., work participation, health care and educational attainment. (2) While vulnerability in different spheres adversely affects QOL of human beings in general, the nature of trafficking, domestic violence and various other crimes against women reveal that they are doubly victimized in this respect and this is dealt with separately. (3) Quality of life of women is never up to the mark unless they are empowered to challenge patriarchy and global inequality and this forms the basis of analysis in the section on ‘Gender and Empowerment’. Here, an endeavour is made to assess, among other aspects, whether and how political participation (in Panchayat) and economic participation (economic activities taken up by Self Help Groups (SHGs), in particular women SHGs) can reshape the existing power relation between the genders and make the marginalized group, especially women, empowered. In this entire exercise the focus is on inter-regional and inter-block variation in an attempt to identify the better and the poorly performing regions/blocks for proper policy formulations. The study analysed so far has revealed, quite expectedly, better performance of Region-I (Blocks in Kolkata surroundings) in the process of human development of the district while Region-III (Blocks in Sundarbans) has been designated as the poorly performing one. It would therefore be quite interesting to study whether the regional differences remain invariant in the analysis of gender and development as well or not. The final section sums up the major findings of the analysis.
8.2 Gender and Development: A Brief History

The discourse on Gender and Development has a long and eventful history. This section makes an attempt to highlight the major theoretical underpinning in this regard.

It dates back to the 1970s when an endeavour was made for the first time to integrate women into the development process (WID approach). Women in Aid agencies argued that development programmes had hitherto ignored and excluded women. Ester Boserup in her pioneering work ‘Women’s Role in Economic Development’ argued that modernization had not benefited women, denying them access to land, training, education and technology. She condemned the tendency of planners to see women as secondary earners and to concentrate on their roles as housewives (Boserup, 1970). WID advocates saw themselves as pragmatic, non-ideological development practitioners (Tinker, 1982), but in fact most of them accepted the basic postulates of neo-classical economic theory and were influenced by the liberal feminist arguments for women’s equality (Jagger, 1983).

In the mid-1970s a critique of WID emerged from the analytical work of feminist scholars at the Institute of Development Studies. Their point of departure was that unequal power relations between men and women prevent women from getting equal access in different spheres of life. Furthermore, they were of the opinion that women’s inequality is not solely a problem of developing countries; women in the so-called developed countries also face a gendered labour market with women’s jobs (and pay levels) at the lower end of the job hierarchy and they are also absent from the corridors of power (whether in politics, religion or finance). Women’s reproductive work is not given social value. As such, they avoided the division that the WID approach appeared to make between First and Third World women (Young et al., 1984).

Using the concept of gender (the socially acquired notions of masculinity and femininity) and gender relations (the socially constructed form of relations between men and women), Gender and Development (GAD) activists analysed how development strategies reshape these power relations. They noted how economic and social change, whether planned or unplanned, often gives greater opportunities to one gender and showed how, in many societies, the development of
the market economy had shifted the balance sharply in men’s favour (Young, 1989). In so doing they questioned the conventional liberal belief that the market economy would help spread egalitarian values and undermine authoritarian and male-biased traditional attitudes. GAD activists also highlighted one important aspect of unequal relations - violence against women, which in many areas inhibited women from taking up opportunities targeted to them, whether literacy classes, credit, agricultural extension, etc.

However, some activists and theorists from the South and a few from the North began to recognize the limitations of even this advance. They began to argue that women would never develop unless they are empowered to challenge patriarchy and global inequality. Many of their arguments were taken up by development scholars working with UNDP, which began to call for a focus on human development rather than economic development alone. Reflections of these thoughts were manifested, in course of time, in the form of the indices viz., the Human Development Index (1990), and the Gender Equity Sensitive Indices viz., Gender-related Development Index (1995) and the Gender Empowerment Measure (1995) in various Human Development Reports (HDR) published regularly since 1990.

8.3 Gender Disparity in Human Development

In this section, one makes an attempt to assess the level of gender inequality that exists in the development process of the district and then tries to analyse whether the situation has changed for the better over time. The HDR of the UNDP measures the gap between the Human Development Index (HDI) and the Gender-related Development Index (GDI) to highlight the gender disparity. The HDI and the GDI, it may be mentioned at this stage, are based on the same three indicators viz., standard of living (measured by adjusted real per capita income), longevity (measured by life expectancy at birth) and knowledge (assessed by adult literacy rate with two-third weight and gross enrollment ratio with one-third weight). However, while the HDI measures the average achievement or overall development of a region without imposing any penalty for the existence of gender inequality, the GDI adjusts the average achievement in accordance with the disparity in achievement between men and women. Hence, the need to construct both the indices is to understand the level of
gender inequality.

Unfortunately, however, data on some important variables viz, real income per capita, adult working population, life expectancy at birth, adult literacy rate, gross enrollment ratio etc are not available at the sub-district or block level — a fact which prevents us from using the standard UNDP procedure to construct the HDI. We have, however used some proxy variables after properly justifying the rationality behind their use, calculated the dimension index for each of the indicators viz, standard of living, health care, educational attainment and constructed the HDI as an unweighted average of three dimension indices.

Problem however crops up when we try to construct the GDI by using proxy variables as a number of such variables are obtained in the aggregate form either at household level (e.g., QOL indicators of Rural Household Survey (2005), using which we construct the Standard of Living Index) or for population as a whole (e.g., indicators of hospital performance, sanitation facility, availability of drinking water etc. in respect of public health care, utilizing which health care index is constructed). Clearly, such data cannot provide us with any information separately for male and female achievement on a specific indicator — a fact that makes it impossible for us to construct GDI using data on proxy variables. We have, however attempted to compute some important sub-indices viz., equally distributed equivalent indices (EDEI) from the indicators considered and ranked the blocks using these sub-indices. But before we describe these indices (Box 1) it seems worthwhile to explain our methodology in detail for analyzing gender disparity in this section.

Of all forms of such disparities, it is argued, the most common one is noticed in the functioning of the labour market—the low female work participation rates according to accepted definition of work and the differential treatment meted out to women even when they are employed. Any kind of gainful work for women brings with it some sense of economic independence, so to say, and enhances their self-confidence, which in turn empowers them to get recognized and involved in decision-making. It is thus very important to examine the extent of female work participation rates, particularly in relation to males and see whether there has been any improvement over time in this regard. Our assessment of gender disparity in human development therefore begins with an analysis of work participation rates by gender.

We basically ask two very important questions viz., (1) how alarming has been the extent of gender-bias? and (2) has there
been any change for the better over time? We attempt to address these two issues mainly on the basis of Population Census data for 1991 and 2001.

How can we measure gender disparity in work participation? We measure it simply by the ratio of female to male work participation rates (%). In others words, it is the female work participation rates as a percentage of male work participation rates. To give a concrete example we consider the value of such ratio for overall (main + marginal) category for the district as a whole in 1991 and find that it is 13% (Table 8.1). What does it mean in respect of gender disparity? It means that work participation rates of females are almost 87% lower than the same of their male counterparts. Thus, the extent of gender gap is, alarmingly high. This is not a surprising result at all, but the ray of hope is that this ratio increases to 23% in 2001 to indicate a decline in the extent of such inequality. Besides considering such ratio, we calculate EDEI on work participation to understand the extent of gender-related development in this respect. We also consider the issue of occupational diversification of female workers and some other relevant issues in the sub-section 8.3.1.

We next consider gender disparities in educational attainment and health care. It is well known that education and health are not only the basic objectives of development but important ends in themselves also. These two human capital issues are treated together because of their close relationship and have been dealt with in detail in chapters 5 and 6 respectively. In two subsequent sub-sections viz., 8.3.2 and 8.3.3 we attempt to make brief analyses of gender gaps in these two facets of human capital formation.

We first consider the issue of health care (Sub-section 8.3.2) which, however owing to lack of relevant data, as discussed earlier, reduces to an analysis of maternal and child (0-6 years) health care. There are two basic data sources viz., Office of the CMOH and the District ICDS. Both however provide with recent data i.e. for 2006-07. We consider the following issues viz., delivery (home and institutional) reports, maternal mortality deaths and status of immunization using the CMOH data. The ICDS data, on the other hand, are used (a) to calculate gender-specific infant mortality rates and (b) to understand (i) the status of beneficiary pregnant and nursing mothers as well as (ii) children (0-6 years) and (iii) nutritional status of children (0-6 years) covered by Supplementary Nutrition Programme (SNP). Here also, we calculate the EDEI on health care for children. However, owing to lack of proper data we confine ourselves to considering below 1
year children only.

Our analysis on educational attainment begins in Sub-section 8.3.3 with the blockwise literacy rates of males, females and female to male ratio of such rates, based on Census data for 1991 and 2001. We calculate next, as in the case of work participation, equally distributed equivalent indices on literacy for these two periods. Educational attainment has another dimension viz., combined gross enrollment ratio. However, owing to data constraint at the tertiary level, as mentioned earlier, we calculate, using the District Information on School Education (DISE), female to male enrollment ratios for the children in the age group viz., 5-14 years for the periods viz., 2001 and 2007. Attendance ratios are more relevant in this regard and to have an idea about such ratios, we next consider corresponding ratios for drop out children in the same age group. However, data for 2001 being unavailable for such children, we base our analysis on the periods viz., 2002 and 2007 and hope that such an adjustment would affect our results only marginally.

Box 1: The Equally Distributed Equivalent Index (EDEI)

The EDEI on any indicator is the Harmonic Mean (H.M.) of Male and Female dimension indices, considered to penalize the difference in achievement between men and women in that indicator.

\[ EDEI = \left[ \frac{\text{Female Population Share (Female Index)} - 1}{\text{Male Population Share (Male Index)}} \right]^{-1} \]

Dimension Index = \frac{\text{Actual value - Minimum value}}{\text{Maximum value - Minimum value}}

In the present chapter, we construct EDEI on Work Participation, Literacy and Infant Health care. Of these indices, the combined dimension index on the last one is calculated as an unweighted average of dimension indices on infant survival rate, full immunization of children (%) and children in ‘Normal’ grade in Nutrition status (%), separately for female and male children below 1 year.

8.3.1. Gender and Work Participation

To begin our analysis we consider the district scenario (Table 8.1) to find that
- South 24 Parganas remains predominantly a rural district, despite a fall in the percentage of rural population (from 87% in 1991 to 84% in 2001). In the population, slightly less than 50% are females in 1991 irrespective of the sector considered and remain more or less the same in 2001 as well.

However, among the workers themselves, numerical strength of females is meagre—around 11% in the total and the rural sector and 7% in urban sector. During 1991-2001, there has, however, been a rise in the relevant percentages — around 18% in total and rural sector and 13% in the urban sector.

Work participation rates for populations as a whole are very low in 1991— not even 1 out of 3 persons is employed. The situation however improves, to an extent, in 1991-2001.

Male work participation rates vary around 49% in the total and the rural sector and a slightly less than 48% in the urban sector. Such rates too rise to more than 50% in all the sectors. This brings us to the analysis of female work participation rates. In 1991, we find that

- these rates are very small both in absolute terms and relative to male work participation rates.
- The absolute rates are 6% in total sector, 6.5 per cent in rural sector and around 4% in urban sector.
- Female to male ratio in work participation rates is least in the urban sector (8.2%) while slightly higher in total and rural sectors (13%).

During 1991-2001, this ratio is found to improve considerably in all sectors in 2001 - total (23%), rural (24%) and particularly in the urban sector (16.5%). In view of the fact there is little difference in the results of total and rural sectors, majority of the population being rural, we base our analysis henceforth, without any loss of generality, only on the total sector.

Coming next to block-wise performance...
(Table 8.2), we find that in 1991,

- overall (i.e. main+marginal) work participation rates for persons as a whole are highest in Namkhana (44.57%) followed by Gosaba (35.93%) and Patharpratima (32.59%)— all in Region-III. Falta (30.86%) in Region-II follows them suit while others display more or less the same numerical strength (around 26 to 28 %).

Disaggregating further we find that

- in case of main work participation rates, the relevant figures vary, on an average, around 26 %, the better performing blocks being Gosaba (28.93 %), Falta (28.41 %) and Namkhana (28.14 %).

- Interestingly, Namkhana shows the highest numerical strength in marginal work participation rates (16.43 %) as well, followed remotely by Gosaba (6.99 %) and Patharpratima (6.26 %).

Coming to overall (main+marginal) female work participation rates, we observe that

- these rates are considerably meager in Region-I (4.69%) and Region-II (4.14 %). A slightly better performance in Region-III (8.75%) is attributed mainly to Namkhana (33.47%), remotely followed by Gosaba (17.50%) and Patharpratima (12.94 %).

- As in case of overall work participation rates for persons, here also, Namkhana displays highest numerical strength in both main category (5.36%) and marginal category (28.11%). But the interesting point to note is that in case of main category, while there are little variations in the values of the blocks, in marginal category; the variations are much higher, particularly in Region-II where Namkhana is followed remotely by Gosaba (12.59%) and Patharpratima (9.85 %).

The least value in female marginal work participation rates, it may be mentioned, is noticed in Thakurpukur- Mahestala (0.27 %).

C + B

Human Development Report

238

C + B


During the period 1991-2001,
- overall work participation rates for persons as a whole, fall in the main category (Thakurpukur- Mahestola being the only exception, where the situation is the other way round) but rise substantially in the marginal category in all blocks (except Namkhana, where it falls marginally). This explains a rise in overall work participation rates in the blocks in the above period.
- Overall female work participation rates, however, rise in this period in all blocks except Namkhana. Such rates rise in main category in majority of the blocks and in marginal category in all blocks. In Namkhana overall female work participation rates decline to 29.03% because a fall in such rates in marginal category (28.11% in 1991 to 22.89% in 2001) outweighs the rise in the
rates in main category (5.36% in 1991 to 6.14% in 2001).

Analysis of work participation rates of persons as a whole and those of females separately show that in 1991 the female to male ratios of work participation rates are alarmingly low — 10% in Region-I, 9% in Region-II and 18% in Region-III.

Disaggregating such ratios further into main and marginal categories considerable gender inequality is noticed in main category, where the ratios are substantially lower in all blocks (Fig.8.1). Ironically, however, such ratios are higher than 100% in marginal category in all three regions as females outnumber their male counterparts as marginal workers (Fig.8.2). During 1991-2001, these ratios rise in the main category and fall in the marginal category in all three regions—a fact that points toward improvement in the relative status of female workers.
The equally distributed equivalent indices on work participation considered next (Tables 8.3 and 8.4), shows a rise in the values of such indices during 1991-2001 for all the blocks except Namkhana — a fact which clearly indicates an improvement in respect of gender-related development in work participation. This is quite an interesting result where Namkhana, Patharpratima, Gosaba and Kakdwip - all in Region-III, emerge as better performing blocks in both the periods.

Source: Same as in Table 8.1

It is well-known that agricultural growth over a period of time has remained lower than the growth in non-agricultural sectors. The gap between the growth in these two sectors began to widen since 1981-82 and more particularly since 1996-97, because of acceleration in the growth of industry and service sectors as well as
fall in investment in agriculture. It would therefore, be instructive to see to what extent this phenomenon has led to a higher growth in employment in the non-agricultural sectors and thereby resulted in occupational diversification in a predominantly rural district like South 24 Parganas. We try to analyze such diversification in respect of female workers exclusively and consider percentage distribution of female main workers over four broad industrial categories (Table 8.5) for 1991 and 2001. One important point needs to be mentioned here. An industrial category is a sector where a person is employed while an occupation denotes his/her type of job or employment. However, looking at the broad industrial categories, one can ascertain as to whether a person is engaged in ‘Agricultural Occupations’ (as Cultivators and Agricultural Labourers) or in ‘Non-agricultural Occupations’ (Workers in ‘Household Industry’ and ‘Other Workers’).
Table 8.5 clearly indicates
- occupational diversification in 1991, in all three regions, to a much greater extent in Region-I followed by Region-II, which gets intensified further in 2001.
- While there has been a decline in the percentage of female workers as both Cultivators and Agricultural Labourers during 1991-2001 in majority of the blocks, it is primarily a substantial rise in such percentages in ‘Other Workers’ category, which explains this diversification. In fact, in the category viz., ‘Household Industry’ there has

been a decline of the relevant percentages in a number of blocks.

- There exist inter-block variations in each region, in particular in Region-III in regard to such diversification. Mention, however must be made of Sagar in this region, where the concentration of female workers has increased in both the categories viz., Cultivators and Agricultural Labourers during 1991-2001.

Some pertinent comments before we pass on to the next sub-section.

(1) The analysis of work participation by gender, carried out so far, is based, however, on accepted definition of ‘work’, an appraisal of which indicates ‘gender-bias’, for not including many activities carried out by women, particularly in rural areas.

(2) This analysis has been undertaken for population as a whole and not for SC/ST population separately owing to lack of data at such level of disaggregation. Also, it has been done for workers of all ages including those, in the age-group viz., 5-14 years (i.e. Child Labourers). For fuller treatment of gender-specific work participation we should consider both these issues.

(3) In view of the fact that female work participation rates are very low, we feel it worthwhile to consider the issue of unemployed female workers and the employment generation schemes to absorb such workers along with their male counterparts (Box 2).

### Box 2: Some Employment Generation Schemes

<table>
<thead>
<tr>
<th>Scheme</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Prime Minister Rozgar Yojana (PMRY)</td>
<td>In the district, this scheme has been implemented by the District Industry Centre since it was launched in the Eighth Five Year Plan. Here, actual number of cases for which loans were sanctioned, though exhibits a rise (387 in 2005-06 to 636 in 2007-08), falls much short of the number of target cases (2020 in 2005-06 to 2520 in 2007-08). Number of unemployed women whose loans were sanctioned, rose from 43 in 2005-06 to 100 in 2007-08.</td>
</tr>
<tr>
<td>2. Self Employment Scheme for Rural Unemployed (SESRU)</td>
<td>Implemented by the Deputy Director, Employment in the district since its inception in 1985, it provides loans (maximum coverage of Rs.35,000/-) in the major trades viz., Tailoring, Grocery, Push sale of Readymade Garments etc. This scheme displays a very slow progress in the meagre numerical strength of both the proposed cases of loans to be sanctioned (16 in 2006 to 24 in 2007) and the number of women whose loans were sanctioned (3 in 2006 to 4 in 2007)</td>
</tr>
<tr>
<td>3. Special Component Plan/ Mahila Samriddi / Adibasi Mahila Swashaktikaran Yojana (SCP/MSY/AMSY)</td>
<td>All these three schemes are implemented by the District Manager, SC/ST Corporation since inception. SCP and MSY provide loans for major trades viz., Tailoring, Vegetable vending, Muri making, Duckery, Poultry etc. AMSY, on the other hand, provides financial help for the trades like Goaterly, Piggery etc. particularly in the blocks having a concentration of tribal population (Gosaba, Canning I, Mathurapur II and Sonarpur). Of these three schemes, SCP performed the best in the last few years with a rise in the number of unemployed women having their loans sanctioned (4181 in 2006-07 to 12,841 in 2007-08). However, in the other two schemes, there has been a fall in the abovementioned number of unemployed women (MSY-157 in 2006-07 to 143 in 2007-08; AMSY-242 in 2006-07 to 104 in 2007-08).</td>

8.3.2 Gender and Health Care

8.3.2.1 Delivery Reports and Maternal Deaths

Our analysis of maternal and child health care begins with the summary of delivery reports (Table 8.6). We designate those blocks as better performing ones which opt for safe motherhood i.e. where incidence of either institutional deliveries or deliveries by trained birth attendants in case of home deliveries (owing to lack of proper infrastructural set up) is higher.

• Quite expectedly, all blocks except Budge Budge II in Region-I emerge as better performing ones with more than 50% institutional deliveries, Thakurpukur-Mahestola topping the list (78%).

• In case of distribution of home deliveries in this region, we find that more than 50% are done by trained birth attendants.

While looking at the relevant percentages of safe deliveries in these blocks, one would say that this is not a very rosy picture and there is enough room for improvement. One also gets a very depressing scenario in this regard by considering the performance of blocks in other two regions, particularly in Region-III. Here, we find that in all blocks percentages of institutional deliveries are quite low.

• In Region-III, Canning-I (29%) records the highest percentage followed by Mathurapur-II (28%) and Joynagar-I (26%) while Canning-II (3%) displays the least value closely followed by Kakdwip (6%), Basanti (7%), and Joynagar-II (9%). However, percentage distribution of home deliveries suggests that barring a few blocks viz., Sagar (31%), Patharpratima (49%), Basanti (51%) Kakdwip (57%), other blocks opt for at least more than 60% home deliveries by trained birth-attendants.

• Blocks in Region-II, follow those in Region-III in terms of performance in this regard. Falta (59%) records highest percentage of institutional deliveries followed by Baruipur (48%) and Diamond Harbour-II (48%). Bhangar-II (11%), on the other hand, displays the least percentage, followed by Bhangar-I (12%) and Diamond Harbour-I (15%). Interestingly, however, in quite a good number of blocks where incidence of home deliveries is higher, at least 60% of deliveries are performed by trained birth attendants.

We next consider the recorded figures for maternal mortality deaths and find that such values irrespective of causes mentioned, are surprisingly low — either nil or insignificant in almost all the blocks.

(Table 8.6A). This fact raises doubts about the quality of such data and makes it impossible for us to analyze the maternal mortality rates. We feel that such important reports need to be properly documented for policy formulation.

### 8.3.2.2 Infant Mortality Rates

The infant mortality rates (Table 8.7) considered next, are found to be higher for the male children in each of three regions, with Region-III showing the highest values for both groups of children (Fig 8.3).

Source: Monthly Progress Reports, ICDS, South 24 Parganas, 2006-07
There however, exists, sufficient inter-block variation, for children of both genders and in each region we can identify some blocks where such rates are higher for female children. These are, it may be mentioned, Thakurpukur-Maheshtala in Region-I, Falta in Region-II and Joynagar in Region-III (Fig 8.4).

Namkhana renders the best performance among all the blocks showing least value for both groups of children (IMR for males-4.83 and IMR for females-2.46). Mention may also be made of Bhangar-I and Diamond Harbour-I where IMR of both genders are less than 10.

8.3.2.3 Immunisation Programmes

Immunization programmes undertaken by the State Government for the children belonging to different age groups are preventive measures against the childhood diseases. To understand to what extent children of a particular age group are benefited by such programme, we need to know what percentages of child population (planned) of that age group are fully immunized. The full immunization programme obviously is different for different age groups. For our purpose, we have considered such programme for children below 1 year (Table 8.8)
where a child needs immunization dozes of BCG, up to DPT III, up to OPV III and of Measles. We notice that (Fig 8.5)

- Region-I performs the best, followed by Region-II. Performance of Region-III, on the other hand, is more or less same as that of the district as a whole.
- Percentages of fully immunized children vary, but are only around 25% on an average. This is indeed a matter of concern in regard to health care provision for the infants and needs to be taken cognizance of properly by the authorities.
- In majority of the blocks, such percentages of immunized female children are lower than the same of their male counterparts; the extent of gender

functioning Anganwadi Schemes (AWS) for more than 15 days per month in each block. Now, in any block, such schemes providing SNP remain open for either 15-21 days or more than 21 days in a month. For our purpose, we consider the percentages of AWS remaining open for more than 21 days per month to total AWS functioning in that block for the entire period of 12 months in 2006-07. Considering the beneficiary mothers first (Table 8.9A), we find that

- Region-I performs the best followed by Region-II.
- Among all blocks, Diamond Harbour-I in Region-II performs the best (96.11% beneficiary pregnant mothers, 95.51% beneficiary nursing mothers) followed by Thakurpukur-Maheshtala (in Region-I), Kakdwip, Namkhana, Gosaba (all in Region-III).
- Blocks like Joynagar-II, Mathurapur-I, and Kultali in Region-III exhibit least percentage values (less than 50%) for either beneficiary pregnant mothers or beneficiary nursing mothers or both. Mention may also be made of Bisnupur-I and Sonarpur in Region-I, which show considerably lower percentage values compared to other blocks in this regard.

Considering next the percentages of SNP beneficiary children for the age group, 0-6 years (Table 8.9B) we find that

- Region-I performs the best followed by Region-II.
- In each region and in majority blocks of a region the relevant percentages are higher for females1. In each region there exists sufficient inter-block variation.
- Among the blocks, the better performing ones are Thakurpukur-Maheshtala followed by Diamond Harbour-I, Namkhana, Kakdwip and Budge Budge–I where the relevant percentages of children for both genders are higher than 80%.
- The poorly performing blocks are Canning-II, Basanti, Joynagar-II, Mathurapur-I and Kultali where the said percentages vary around 44 percent to 48%.

The enrolled children for SNP programme are weighed and grouped into the following categories according to their nutritional status viz., (a) normal (b) grade I (c) grade II (d) grade III and grade IV. Children in the last two grades, considered together, are categorized as severely malnourished while those in grade II suffer from moderate malnutrition. Though grade I children weigh less than the normal children, their degree

---

1 We have considered such percentages of SNP beneficiary children below 1 year, in 1-3 years and in 3-6 years but report the result only for the first group of children. This feature is noticed in each age group. This explains, to an extent, the lower values of IMR for the girl children.
of malnutrition is not even moderate. For our purpose, we therefore consider two categories viz., normal and grades II-IV (Table 8.10). We find that percentages of female children in the ‘Normal’ category to total female children weighed are smaller than the corresponding percentages of male children, while for ‘Grade II-IV’ category the picture is the other way round. Considering children in the ‘Normal’ category first, it is noted that percentages of both male and female children in the age-group viz., 0-6

Though we have considered these results for children in the age groups below 1 year, 1–3 years, 3–6 years, to avoid a cumbersome presentation, we report the results for children in the age group viz., 0-6 years.
malnourished children are concerned,

- Region-I again emerges as the best performer with least values for children of both genders (males-9.48%, females -13.81%) followed by Region-II ((males-12.31%, females –16.26%).
- While for female children, these percentages are highest in the age-group viz., 1-3 years in majority blocks, particularly in Region-II, for male children the corresponding percentages continuously rise in such blocks.

We next consider the percentages of female children weighed to total (female+male) children weighed in the age-group viz.,0-6 years (Table 8.11 ) to find that such percentages are least in ‘Normal’ category but rise with increase in the grade of malnutrition. This observation clearly indicates gender disparity when children are evaluated by their nutritional status.

Fig 8.6: Percentages of Girl Children to Total Children (age 0-6 years) by Nutritional Status

At this stage, it may be pointed out that we have calculated the equally distributed equivalent index on health care for children below 1 year using the following indicators viz., (i) male and female infant survival rates (ii) percentages of fully immunized male and female children and (iii) percentages of male and female children normal grade in nutritional status. We have also computed the dimension index in these indicators as well (Table 8.12). Interestingly however, this result does not indicate gender inequality measured as the difference of these two indices in relative terms. This is an important result, no doubt, but calls for further research to understand the gender disparity in health-care provision among children above 1 year.

8.3.3 Gender and Educational Attainment

We first consider the district scenario (Table 8.13) and note that gender gap in literacy rates, though considerably high, particularly in the rural sector of the district —declines during 1991-2001.

The literacy rates in blocks in both 1991 and 2001— for population as a whole and males and females separately are considered next (Table 8.14). Our main task is to assess gender gap in literacy rates, measured by female to male ratio of such rates. Considering the region-wise performance in this regard we observe that

- Region-I performs the best followed by Region-II in each of these cases viz., literacy rates of persons, male and female and gender gap in such rates in 1991 and 2001 (Fig 8.7). Intertemporal variations in each case for other two regions too indicate an improvement. Inter-block variation is not so much pronounced in Region-I compared to such in other two regions, in particular Region-III.
- One important point to note is that during 1991-2001, female literacy rates rise at a faster rate than male literacy rates—a fact which causes the gender gap in literacy rates to decline in this period. While this feature is noticed in all three regions, it is the blocks in Region-III, the poor performers in 1991, who perform the best in 2001.

---

**Fig 8.7: Female to Male Ratio of Literacy Rates (%)**
We next calculate the equally distributed equivalent indices on literacy for the blocks in 1991 and 2001 (Tables 8.15A and 8.15B).

- Interestingly, majority of the blocks belonging both to the group of better performing ones and the group of poorly performing ones in 1991, though interchange their position within their respective group, remain in the same group in 2001 as well. While Thakurpukur-Maheshtala, Budge Budge—I, Sagar, Namkhana and Bishnupur-I
figure in the better performing group, Canning-II, Joynagar-II, Basanti and Bhangar-I remain in the poorly performing group.

- While in 1991, Thakurpukur-Maheshtala tops the list jointly with Sonarpur; in 2001, it is Namkhana which emerges as the best performer. Sonarpur performs moderately in 2001 and remains no longer in the group of top ten better performing blocks.

Source: Same as in Table 8.1

We next consider the gender – gap in enrollment and drop-out of children in the age group viz., 5-14 years for the blocks in 2001 and 2007. For drop-out children we do not have data for 2001 and base our analysis on 2002 (Tables 8.16A and 8.16B).

- Region-II performs the best in respect of both indicators where female to male ratio for enrollment is highest
and the same for drop-out are the least (Figs. 8.8 and 8.9).

- Interestingly, figures of the relevant ratios for enrollment of children in 5-14 years exceed 100 in a number of blocks in 2007, implying thereby that the absolute number of female enrollment has been higher than that of their male counterparts. (Table 8.16A). Similar reasoning can be applied to understand such figures (greater than 100) of dropout ratios in a few blocks in 2002 (Table 8.16B). Inter-temporal variation suggests an improvement in enrollment ratios and a decline in drop-out ratios in majority of the blocks, implying thereby an improvement of the attendance of female children relative to male children in the above age group.

Source:- District Information on School Education, South 24 Parganas, 2002 and 2007

While the functioning of Sarva Shiksha Abhiyan (SSA) and its various components like Kasturba Gandhi Balika Vidyalaya (KGBV) scheme, National Programme for Education of Girls at the Elementary Level (NPEGEL) can account for this impressive result to a great extent, the district ICDS too assumes very important role in providing pre-school education and SNP to the children in the age group viz., 3-6 years. And it is sincerely felt that provision of SNP to children above 6 years, particularly to girl children in their adolescent period can yield further better result in this regard.
8.4 Women and Vulnerability

While vulnerability in different spheres adversely affects QOL of human beings in general, trafficking, domestic violence and various other crimes against women make their lives more vulnerable than their male counterparts. Crimes against women, in particular gender-based crimes, are in general, rooted in ideological differences between men and women. These are usually related to the concentration of power in men’s hands and a belief that women are men’s possessions to be treated as they wish. Despite the existence of much special legislation for providing protection to women, the proportion of crime against women in the country has not deteriorated over time.

8.4.1 Crimes against Women: An Overview

The categories of Crimes against women (CAW) under the Indian Penal Code are as follows:-

1. Rape (Sec. 376 IPC)
2. Kidnapping and Abduction for different purposes (Sec. 363-373 IPC)

Source: - A situational analysis of violence against women in West Bengal vis-à-vis India, Women Studies Research Centre, Calcutta University (2007)

Note: - Figures in parentheses are percentages to total for West Bengal
3. Homicide for Dowry, Dowry Deaths or their attempts (Sec. 302/304B IPC)
4. Torture/Cruelty - both physical and mental - (Sec.498A IPC)
5. Molestation (Sec. 354 IPC)
6. Sexual Harassment/Eve-Teasing (Sec. 509 or 294 IPC)
7. Importation of girls up to 21 years of age (Sec. 366B IPC)

This section highlights some major forms of crimes against women prevalent in the district of South 24 Parganas. The total no of IPC CAW cases (Table 8.17) in the district over the years 2000 and 2003 show a distinctly rising trend in crimes against women with South 24 Parganas leading among the districts both in terms of absolute numbers and in relative terms.

Within South 24 Parganas there is tremendous interregional variation in overall crime rates as well as in CAW. Taking the average values of the total incidence of crime over three years from 2005 to 2007 it is seen that on an average no of violent crimes decrease as one moves away from Kolkata towards Sunderbans but the incidence of CAW is particularly high in the Sunderbans.

Figure 8.10 : Average incidence of Violent Crime & CAW in South 24 Parganas : 2005-07

The higher incidence of crimes against women in the Sunderbans area has been consistent over the years as depicted in the table below where a temporal dimension is associated with block level CAW occurrence. The fact gets portrayed in the Table 8.19 and figure 8.11 below.

### Figure 8.11: Trends in incidence in number of CAW Cases in South 24 Parganas, 2005-2007

Several NGO-s are involved in studies and implementation programmes in the domain of CAW including trafficking. A few relevant case studies are included for information and deeper understanding.
Case study 1

HARIPUR AMRA SABAI UNNAYAN SAMITI (HASUS), has been working on the establishment of social and economic rights of women for a couple of years in South 24 Parganas. In the experience of the organisation, among women who have migrated to the city in search of work, every day hundreds are found missing. The facts and figures gathered by the organisation shows that from villages of Mandirbazar, Mathurapur I and II, Magrahath I and II, Kakdwip and Kulpi Blocks, many girls below 18 years have been trafficked to Kolkata, Delhi, and Mumbai on the pretext of jobs. The statistics shows, surprisingly, that the girls who have been trafficked for prostitution have gone with strangers. Their parents are not very sure whether they are actually working as domestic help or being used for some other purpose. Girls between 13 to 14 years of age do not seem to communicate with their parents or guardians after they have migrated to the city in search of work but girls who got married and have left their children at home keep contact with their family members. Child marriage is another major issue which is increasing at a very alarming rate with each passing day. Girls who are above 16 years of age are rarely seen in the villages as they are married off as soon as they reach the age of 14-15 years.

Case study 2

In the experience of GARAN BOSE GRAM BIKASH KENDRA in Canning I,II and Basanti Blocks there are many instances where young migrant girls, taken away with the pretext of jobs, have been forced into prostitution. It is interesting to note that the number of hotels and shanties surrounding the ‘Mazar’ has increased. The young girls of Ghutiarisharif and other nearby villages come to these hotels for prostitution. In general traffickers use the methods like kidnapping, promises for a better job, and procuring through marriages (quite often fake marriages) in trafficking. Very often women and girls are sold by their own kins. Rape victims are also sold into prostitution as they are unfit to lead a normal life.

Another glaring feature of crimes against women is revealed by the following table which infers that South 24 Paraganas is one of the high rankers in terms of incidence of sexual assaults as compared to the State comprising 18 districts.

Table 8.20: Incidence of Sexual Assaults against Women in South 24 Paraganas vis-à-vis West Bengal in 2002

8.4.2 Post marital violence and dowry deaths

The composition of crime in the districts is biased towards post marital violence accounting for more than half of the total crimes in 2002. In terms of share of total CAW cases in the state, South 24 Parganas takes the lead among all 18 districts as per
the report of the West Bengal Commission for Women. The absolute IPC CAW component figures in three time periods depict a rapid increase in torture and cruelty by husbands and relatives. The prevalence of dowry deaths and the temporal dimension as reported in the crime figures do not provide a conclusive picture. The year 2001 depicts a sharp decline which could just be accidental.

On the aspect of age of marriage in South 24 parganas the following facts were revealed.

- In rural areas 65.49% of married population in the age group of 10-14 is girls. While for urban areas this is only 6.5%.
- In rural areas 91.33% of married population in the age group of 15-19 is girls. While for urban areas this is 88.19%.

A study conducted by Calcutta University revealed:

- A situational analysis of violence against women in West Bengal vis-à-vis that in India-Calcutta University (2007) in Ramchandrapur and Kalinagar villages of Diamond Harbour I Block revealed the dimensions associated with dowry. In Ramchandrapur the overall scenario had a reflection of well being. Employment was reported to be mostly in organized service sectors, or in family business. But in Kalinagar the standard of living is low, and people are mostly working as migrant labor in unorganized sectors or as household labour. The following points were revealed from the study:

  - Dowry is common and takes place in a cyclical manner with dowry taken in son’s marriage and given off in daughter’s marriage.
  - Family is thus an institution of gaining capital in the process.
  - The level of dowry is Rs. 20,000 to Rs. 40,000.
  - Dowry torture is common.
  - Poverty is one of the reasons of child marriage and dowry.

Source: Sexual Violence and the Law: West Bengal Commission for Women, Kolkata 2005
• Groom’s family is poor and so needs some capital for maintenance of the bride in the family and this is how villagers justify dowry.
• Suicide of brides is also heard of in dowry tortures.
• The general age of marriage of girls starts from 12.
• Even educated brides and their parents confidently express the existence of dowry in their own lives in a supportive way.
• Dowry is not looked upon as humiliation of the bride by any family.

In 1998 Women Studies Research Centre, Calcutta University, undertook a project on the status of Muslim women in West Bengal. As a part of the study survey was conducted in three villages in the district of South 24 Parganas. Survey revealed that all the respondents confessed that they had to go through the exchange of dowry in marriage and also confessed to accepting it as a custom and felt there was no way of combating it. Other studies in the domain of postmarital violence infer similar points and hence could be considered as a general deduction.

8.4.3 Trafficking

Trafficking in women and girl children is a matter of great concern all over the world. In South Asia cross-border trafficking, sourcing, transit to destination is a big problem. Even more prevalent is the movement of persons within the countries for exploitation in various forms. West Bengal falls within the wide criminal network where South 24 Paraganas acts as a major sending point. Trafficking and consequent white slavery with sexual exploitation is a multi billion-dollar business - as important as dealings in drugs and ornaments. Extensive consultations verified that there is a severe lack of concrete data from which an accurate picture of the scope of trafficking may be drawn. Traffickers go to great lengths to avoid monitoring of their illegal activities and any available data must be treated with caution.

Sanlaap, a renowned NGO, has been involved in the rescue and rehabilitation of minor girls who have been trafficked for commercial sexual exploitation. During the course of restoring these trafficked victims back to their families, they have been able to identify those eight districts from where these girls have been trafficked, South 24 Parganas being identified as one of the most vulnerable.
Case study 3
Study conducted by
ASHURALI GRAMONNAYAN PARISHAD
The areas covered under the study are three villages under the Kalatalahat Gram Panchayat of Diamond Harbour II block of South 24 Parganas district. The Majority of the girl children are married off in the age group of 15-17 years. However, the distribution in the other age ranges is also remarkable. The fact that child marriage occurs in the age range of below 9 is alarming by itself irrespective of the number or percentage. Quite a number of these are married off to Bihar through mediators who come to work from Bihar in the Falta export-processing zone and growth Centre. There are also cases when men from Bihar have directly got married to the local girls of these villages and have taken them away to Bihar. There have been incidents where the girl has been married off to places like Delhi through mediators from Bihar and have been found to be missing till date.

Indian Express, the daily, reported on the plight of the vulnerable section

*The Indian Express, 14 August 2007 reports.....*

**Five minors rescued from Maharashtra brothels**
NEWS, Kolkata, August 5: The Anti-Human Trafficking Unit (AHTU), which was inaugurated a month back, has rescued seven young girls from Mumbai and other suburbs of Maharashtra and brought them back to Kolkata. A six-member team went to Maharashtra to rescue the girls, who were trafficked from South 24-Parganas and North 24-Parganas. The girls were sold in various parts of Maharashtra for being used as commercial sex workers.

Sexually transmitted infections (STIs) present a large burden of disease and debility. As per a recent STI prevalence study of National Aids Control Programme (NACP-III), over 5% of adult population in the country suffers from STIs. In South 24 Parganas the RTI data reveals some very interesting features. The blocks Kultali, Canning-I, Canning-II, Basanti, Baruipur, Gosaba, Falta, Magrahat-I & II, Diamond Harbour I & II specially attract attention in terms of prevalence. In these blocks RTI/SI rates are very high among females. In Kultali block cases detected is 808, cases treated is 335 and cases referred is 473 while in Canning-II the number of cases is very high accounting to 3058 cases detected, 792 cases treated and 2266 cases referred. Further, Falta and Diamond Harbour also are pretty high in terms of cases detected, treated and referred - 2288, 1114 and 1171 in Falta and 1793, 1599 and 194 in Diamond Harbour-I respectively. On the other hand these blocks are identified as human trafficking and migration prone areas. This establishes a very strong relationship between the occurrence of disease and the extent of trafficking and migration. As indicated in South 24 Paraganas, a large
section of men migrate to Delhi, Haryana, Punjab, Rajasthan, and other parts of West Bengal. On the other hand, women and girls leave their abode either in search of work or are trafficked from these areas. The migrated people when they come back home, infect their wives and on the other side the trafficked girls when rescued from the brothel are often infected by the sexually transmitted diseases.

8.5 Gender and Empowerment

Development practitioners and policy makers from all perspectives seem to agree that empowerment is a necessary ingredient for women’s development and gender equity in this world. A detailed study of women’s participation in the socio-economic-political arena of South 24 Parganas helps us to identify the following issues to be contributing significantly to the process of women’s empowerment. These are:

- Distribution of surplus ceiling land to women
- Provision of vocational training to adolescent girls under *Kishori Shakti Yojana*
- Functioning of Self Help Groups (SHGs), in particular of Women SHGs.

These activities are coordinated by the administrative body viz., Panchayat. It is the Panchayat again, where the criterion of minimum reservation of seats may help women to take part as office bearers in the decision-making processes. The analysis in this section, therefore, begins with the discussion on women representatives in the Panchayat.

8.5.1 Women in Panchayat

At the outset, it seems worthwhile to mention a few known facts for ready reference. First, Panchayat is a three-tier administrative body with the administrative units viz., Zilla Parishad at the district level, Panchayat Samity at the block level and Gram Panchayat at the village level. Second, the procedure of reservation of seats for SC/ST women is different from the same for general women. In case of SC/ST population in any block, say, proportion of their seats reserved to total seats in each tier of Panchayat is equal to their proportion in total population in that block. And then, out of the total seats reserved for SC/ST population. 33.33% is reserved for SC/ST women. Of the remaining total seats, 33.33% is reserved for general women. While we are interested in assessing both the current situation and the inter temporal variation in women’s representation in the Panchayat, non-availability of data on

Source: District Panchayat & Rural Development Office, South 24 Parganas 2003
previous general election of Panchayat confines our analysis exclusively to the seat allotment of 2003 general election. Performance of a block is evaluated on the basis of its having excess of percentage of seats actually reserved over the percentage of minimum reservation of seats. In other words, the higher the value of the excess seats over minimum reserved seats in percentage form, higher is the rank of a block.

Examining the situation at the Gram Panchayat level first (Table 8.23A) one finds that

- for the SC/ST women, all blocks barring Bishnupur-II in Region-I exhibit excess over minimum reservation(%). While in Bishnupur-II, the criterion of minimum reservation of seats (%) fails, it is interesting to note that no block of Region-I figures in the list of top ten better performing blocks. These are, it may be mentioned, Canning-I, Kulpi, Magrahat-I, Sagar, Canning-II, Diamond Harbour-I, Bhangar-I, Mathurapur-I, Falta and Bhangar-II.
- Unfortunately however, for the general women, the situation is not so rosy and in ten blocks, the criterion of minimum reservation of seats (%) does not hold good. The blocks are Bishnupur-II, Sonarpur in Region-I; Magrahat-II, Kulpi, Mandirbazaar in Region-II and Canning-I, Basanti, Joynagar-II, Mathurapur-I Sagar in Region-III. In all other blocks, however, there exist excess over minimum reservation of seats (%).

Next, at the level of Panchayat Samiti (Table 8.23B) the data reveal that

- a number of blocks show minimum reservation strength (%) for the SC/ST women. These are Thakurpukur-Maheshtala, Bhangar-II, Falta, Canning-II, Joynagar-I, Joynagar-II. Rest of the blocks has excess over minimum reservation (%).
- For the general women, however, we again get a somewhat mixed result where some blocks fail to satisfy even the criterion of minimum reservation of seats (%). These are Budge Budge-I, Sonarpur, Kulpi, Mathurapur-I, Mathurapur-II, and Patharpratima, Kakdwip, Canning-I and Namkhana.
- Blocks like Joynagar-II, Kultali, Joynagar-I, Canning-II in Region-III and Diamond Harbour-II, Magrahat-I, Magrahat-II, Bhangar-II, Falta in Region-II are designated as the better performing ones. Rest of the blocks exhibits minimum reservation of seats (%).
Thus, both at the Gram Panchayat and Panchayat Samiti, particularly in the former, SC/ST women are better represented compared to the women in general category. Such a conclusion, however, cannot be drawn at the Zilla Parishad level (Table 8.23C) where total number of seats varies between 1 and 3. This analysis of women’s participation in Panchayat seems to be incomplete without information about the socio-economic profile of the women representatives, posts held by them as office-bearers and instances of their being involved in decision making and thereby motivating commoners, particularly women at home to enhance their participation in Panchayat. It is only then that we can infer whether the women representatives have been able to reshape gradually the existing power relation between men and women in political arena over time.

### 8.5.2 Women Pattadars

We next consider the percentages of women Pattadars in different blocks of the district up to February 2008 (Table 8.24). At this stage, we may recall, percentage distribution of female workers in 1991 by industrial categories clearly indicates occupational diversification, which gets further accentuated during the inter-census period 1991-2001. Percentage of rural

population too declines from 87% in 1991 to 84% in 2001. Despite these facts, South 24 Parganas remains pre-dominantly a rural district where women have very little access to land ownership. In such a situation government programme of redistributing surplus ceiling land to women (either in their single names or jointly), particularly of BPL households, may not only help them to enhance the QOL of the members of their households but increase their self-confidence and self-esteem also. In this way, this act of gender-mainstreaming may lead them towards empowerment.

Source: Same as in Table 8.23A
The relevant official statistics obtained up to February, 2008, yield a promising picture for the district as a whole where the combined percentages (37.1%) of single women Patta holders and joint patta holders are much higher than the same for the state.

Within the district, however, it is the single men patta holders who dominate in the redistribution programme of surplus ceiling land in majority of the blocks.

There exists sufficient inter-block variation, however, in each region. The percentages of single women patta holders are highest in Joynagar-I.
(29%) followed by Bishnupur-I (25%) while least in Thakurpukur-Mahestala (nil), followed by Bhangar-II (0.3%) and Kultali (0.7%).
- Region-III shows considerably higher percentages of joint patta holders (35.8%), mainly due to the performance of Canning-II (78%), Basanti (74%) and Gosaba (80%)
- In Thakurpukur-Mahestala block of Region-I, it may be mentioned, all pattas are redistributed jointly.

8.5.3 Vocational Training under Kishori Shakti Yojana

At the penultimate stage of this section we consider the Vocational Training Programme for improvement of individual as well as social status of adolescent girls in the age-group viz., 11-18 years, launched under Kishori Shakti Yojana (KSY) in 2006-07 in all districts of West Bengal. KSY, it may be mentioned, is a component of centrally sponsored ICDS (General) scheme and in West Bengal, it is run by the district ICDS in each district under the Department of Women and Child Development and Social Welfare, Government of West Bengal. In South 24 Parganas district all blocks except Bhangar I, have undertaken this training programme during 2006-07. Before we consider the blockwise report of the training programme of KSY in this district (Table 8.25), a brief overview of the guideline of the programme in general is given in Box 3.

Box 3: Vocational training under KSY: A Guideline

In this programme, in a particular block, 4 to 5 groups, each consisting of 30-35 Kishories living in 2 to 3 adjacent Gram Panchayats are selected from survey lists of Anganwadi workers by the CDPO, who is in charge of the project. In selection procedure preference is given to those Kishories who belong to BPL families and/or drop out from schools, and/or victims of early marriage mishaps etc. The primarily selected Kishories assemble and go through the following sections:-

1. Adolescent group formation- After counseling their parents about the training programme, the selected girls are given lessons about group dynamics so as to make them understand the necessity for group formation and realize that self help initiative along with collective efforts can improve social status.

2. Life cycle training – They are made acquainted (know thyself) about themselves through an understanding of personal hygiene, sanitation, population education particularly regarding psycho-sexual issues and changes towards potential womanhood. At this stage, anemic girls are given deworming tablets like Iron and Folic Acids.

3. Social Safety net – They are given lessons to (a) understand their families neighbours and communities; (b) be aware of domestic violence, social issues like early marriage, dowry and trafficking, abuse and atrocities on women in our society in different forms and (c) understand the importance of education for self security

4. Exploring unique qualities for future advancement- Talents of selected girls are nurtured, with a belief that every human being possesses some unique quality, through regular dialogues and exposures in writing abilities, painting, dance, drawing, food processing, music, acting, recitation, embroidery work, boutique work etc with an objective to understand their aptitude for vocational training.

At the end of this preparatory phase, progress report of the KSY preliminary efforts are placed before the District & Project Officials, experts from NGOs & Panchanyat representatives. Finally, arrangements for vocational training of 240 hours stretched over 3 months are made after considering, among other factors, (a) suitable trade as per need of the locality, (b) availability of master trainer in the area (c) infrastructural facilities and (d) availability of raw materials and market linkage after production. After successful completion of the programme, the Institute imparting training and the CDPO provide certificates jointly.

Source :District ICDS,South 24 Parganas
We may now consider the block-wise report in South 24 Parganas (Table 8.25) to find that

- there exists variation in the nature of vocational trade imparted owing to difference in market linkages in region. Thus in Namkhana, a block adjacent to Sunderban in Region-III, the adolescent girls are given training on fish net-making apart from food processing. Similar instances may also be given.

- However, despite such variation, cutting and tailoring emerge as largest vocational trades in majority blocks followed by Zari work in a number of blocks.

Source: District Programme Officer ICDS, South 24 Parganas
Some pertinent questions arise at this stage:

- What happens to the adolescent girls after they complete training and receive certificates? We need follow-up studies.
- What is the basic objective of such training? Is it imparted just for the sake of giving them certificates or for integrating them properly into the labour market so that they can later join the Self Help Groups, undertake economic activities jointly and uplift their families above poverty line or they can as individuals begin some economic activities and thereby attempt to improve the quality of life of their families?

Although success stories of some girls in a number of blocks indicate that they have formed Self Help Groups later on while others have individually begun economic activities, it seems that no proper monitoring of the job market provisions of such girls has been done in the last year after completion of training. We sincerely feel that such vocational training under KSY, has tremendous potential and can help change lives of adolescent girls for the better in the following ways:

- It can help the adolescent girls, who are victims of early marriage mishaps or domestic violence, to be economically independent and lead a respectful life.
- It can combat the problem of trafficking due to migration by preventing the poor young girls from going away from their home in search of job and thereby help in reduce the prevalence of diseases like S.T.I.
- Lastly, it has a good potential for income generation if it can be integrated with the SGSY. And to realize why we do feel it, we need to understand the process of gender empowerment through the functioning of Self Help Groups (SHGs), in particular, women Self Help Groups, under the SGSY in the blocks of South 24 Parganas. It is to this that we turn next.

8.5.4 Functions of Self Help Groups under SGSY

It dates back to 1st April, 1999 when the Swarnajayanti Gram Swarojgar Yojana was launched as a long-term rural self-employment programme, after integrating the earlier programmes like IRDP, DWACRA, TRYSEM and SITRA. Its main objective was to organize small economic activities, make members of BPL families, in particular women engaged into such activities and make the rural poor marginalized women empowered as members of Self Help Groups, earn sufficient income to uplift the quality of life of the households above the poverty line. A SHG, it may be mentioned at this stage is formed by 10-15 people each from a different household, preferably BPL, living in the same locality/village of a block. While majority of the SHGs are formed exclusively by women, a few are formed exclusively by men and the rest are
Box 4: Self Help Groups under SGSY: A guideline

It is the Self Help Promoting Institute (SHPI), usually a NGO, which plays a major role in motivating and forming a Self Help Group. After several rounds of meeting, the list of the people interested in forming the group, along with the recommendation of Gram Panchayat Pradhan is sent to the District Rural Development Cell (DRDC) for its approval. Once the approval is given, the SHG is formed, with the date of their first meeting considered as the date of the group formation. After the group is formed and its name and dates of monthly meetings are fixed, members are motivated enough to save regularly as per their capability and after about one month a savings account is opened with a regularized rural bank or a nationalized bank in the joint names of all the members. The savings account, it may be mentioned at this stage however is operated by two persons, fixed by the members themselves and each member keeps records in her own handbook. After one month or so, members, one by one, can take personal loans as well as loans for carrying out small economic activities and repay such loans with interest inclusive of both bank interests and interests accrued due to inter lending among members. DRDC provides Basic Orientation Training to the members of a group under the guidance of SHPI, where they learn about the functioning of a SHG and SGSY in detail. In the meantime, they take part in some social activities as well like Sarva Shiksha Abhiyan (SSA), Pulse Polio Immunization programme, sanitation programme etc. All these continue for at least six months after the group is formed and then the SHG members appear for their first evaluation viz, Grade I evaluation.

A SHG passes this test with minimum of 60 % marks depending on its performance for the past six months mainly in the following aspects, among other things:

(a) Whether meetings are held regularly and the rate of presence of members in the meetings are satisfactory,
(b) Whether savings are made regularly
(c) Whether the loans taken from the savings are repaid properly
(d) Whether the group is involved in social work and the extent of its involvement, and
(e) Whether the helper is involved in the regular activities of the group.

The bank in question opens another account viz., the ‘Cash Credit A/C’ in the name of the group which passes Grade I, of the amount up to four times higher than the group corpus. The DRDC gives a revolving fund (RF) to the group of amount Rs. 5000. A SHG may then take loans from Cash credit A/C to carry out small economic activities either in individual capacity or as a group depending on the decision of the group in this regard.

The DRDC makes arrangements for skill upgradation training to enhance the skill of the members of a group and enable them to carry out their individual or group economic activities in a much better way. In this way the members of a SHG after passing Grade I, make attempts to improve the standard of living of the respective BPL households, they belong individually to, and gradually prepare themselves for undertaking large economic activity as a group in future. A Grade II test is held after at least six months of passing Grade I test, to examine the group potential for undertaking large economic activity. Performance of a group depends mainly on the following aspects:

(a) Indicators of Grade I evaluation, mentioned earlier,
(b) Whether the amount of RF has been used properly
(c) Whether the repayment of loan taken from Cash Credit A/C has been satisfactory, and
(d) Whether the group has really been able to form a proper idea about implementation procedure of its undertaking large economic activity.

At the end of Grade II evaluation, two types of results may happen:

Case 1: The SHG gets more than 60 % marks but less than 80 % marks. Case 11: The SHG gets 80 % or more marks.

In Case 1, the relevant group is not considered eligible to get loan from bank for undertaking large economic activity. It is, however, given some more time to increase its potential in this regard. In this case, the DRDC may, give another RF of amount Rs. 5000/-. The Bank too may enhance its upper limit of cash credit a/c after reviewing the amount of group corpus of the SHG at that time.

In Case II, the concerned SHG is considered to have successfully completed the Grade II evaluation. Accordingly, it is asked to submit a project to the bank indicating clearly about its proposed large economic activity and the amount of loan it requires for this purpose. Bank sanctions its loan, depending on the past performance of SHG in regard to loan repayment. After bank’s sanction the project is submitted to DRDC which gives it a subsidiary amounting to either 50 % of project cost but not more than the maximum limit of Rs 1.25 lakhs or Rs.10, 000 per BPL member, whichever is smaller. Bank disburses its loan, after duly opening a loan account with the name of SHG. All loans are mid-term ones, with 5 years as the time limit for repayment. The DRDC again arranges for training of the SHG to make it understand about the procedure of loan repayment and running an enterprise. Constant monitoring continues with an aim to help each member to earn at least Rs 2000/- per month, improve the socio-economic condition of the respective BPL families and thereby make them self-reliant.

Source: DRDC, South 24 Parganas
mixed groups of which again more than 80% are women. In view of this poor numerical strength of men SHGs and overwhelming presence of women in mixed SHGs, we make our analysis of gender empowerment without any loss of generality, on the basis of performance of SHGs as a whole. A brief discussion on how a SHG functions in general is given in Box 4 to help our understanding for evaluation of the block-wise performance of the SHGs in the district.

In the light of the basic guideline about the process of gender empowerment through the functioning of SHGs, an evaluation of the blockwise performance of the district on the basis of data up to 2007 provided by the DRDC is attempted below (Table 8.26A). The following indicators have been considered since the stage of inception of a SHG to carrying out economic activities by such group after completion of Grade-II evaluation:

1. Percentages of SHGs formed to total BPL families,
2. Percentages of SHGs passed Grade-I to total SHGs formed,
3. Percentages of SHGs passed Grade-II to total SHGs passed Grade-I,
4. Percentages of SHGs pursuing economic activities to total no of SHGs passed Grade-I,
5. Percentages of SHGs pursuing economic activities to total number of SHGs passed Grade-II,
6. Percentages of women SHGs to total SHGs formed, and
7. Percentages of women SHGs in total SHGs pursuing economic activities (Grade-II).

3 The absolute number of SHGs formed per block is definitely an important indicator but given the fact that a SHG is formed by taking each member from a different household, preferably BPL ones, percentages of SHGs to BPL households is more relevant.

Source: District Rural Development Cell, South 24 Parganas
The blocks are ranked according to their performance where, it is needless to say, a higher percentage value yields a better rank for a block. We calculate the **BORDA scores** and finally get the **BORDA rank for blocks** (Table 8.26B). Let us now, in a brief, analyze the performance of the blocks on the basis of each of these indicators.

In respect of the first indicator, however, the picture is not at all rosy. It is highly disturbing to find that after a period of more than ten years since the SGSY was launched, almost all blocks in this district display meagre percentages of SHGs formed to BPL households.

- Sagar (31.51%) tops the list followed by Bhangar-I, Joynagar-II and Namkhana among other better performing blocks in this regard.
- Thakurpukur-Maheshtala shows the least value (0.33%) jointly with Budge Budge-I.

We however get a promising picture in respect of the second indicator.

- Majority of the blocks (20 blocks out of 29 blocks) display values around 60 % or more. Kulpi (97.33%) tops the list followed by Bishnupur–II (93.12%) Diamond Harbour-II (81.49%), Budge Budge-I (80%) among other better performing blocks.
- While Mandirbazar exhibits the least value (29.75 %) followed by Basanti, Sonarpur, Bhangar-II, among other poorly performing blocks.

Performance of the blocks is not praiseworthy when we consider them in respect of the third indicator. There does not exist a single block where even 50% of the SHGs who passed Grade-I test have been able to clear the Grade-II test.

- Namkhana (48.95%) is the best performer followed by Mandirbazar (38.89%) and Thakurpukur-Maheshtala (35.56%).
- There is not a single SHG in Canning–II which passes Grade-II evaluation and
- Baruipur (9.83%) is the best among last ten poor performers.

Percentages of SHGs pursuing economic activities after passing Grade-I evaluation is however definitely praiseworthy.

- In majority of the blocks the relevant percentage is more than 70.
- Even in the poorly performing ones Bhangar-II, Thakurpukur-Maheshtala, Sonarpur etc. these percentages vary around 40.
- The best performer is Bishnupur-II (91.13%).

Such an impressive result is attributed, among other things, to a great extent, to the skill upgradation training imparted by DRDC. At this stage, it needs to be mentioned that there is a striking similarity between vocational trades under KSY and economic activities pursued by SHGs (Table 8.26A). And herein lies the relevance of integrating the vocational

---

4 The BORDA score of a block is the sum of its ranks, evaluated on the basis of alternative criteria mentioned. Using this combined score, blocks are finally ranked by their overall performance.

(ii) Same as in Table 8.26A
training of KSY with the functioning of SHGs under SGSY. If the trained adolescent girls, after attaining adulthood, can become members of SHGs, they can utilize their experience of previous training in a much better way. Although it may be argued that a trained adolescent girl after marriage may live in a block having different market linkage and hence demand for different types of trades which she did not get training for. Even in this case the fact that she got training earlier would definitely motivate her to be a member of a SHG to a much greater extent compared to other girls who did not have the opportunity to get such training.

The picture, however, gets blurred when we consider performance of the blocks in respect of the fifth indicator.

- A number of blocks, performing satisfactorily so far, perform poorly in this regard. In eight blocks viz., Kultali, Joynagar-I, Canning-II, Mandirbazar, Bhangar-I, Bhangar-II and Sonarpur there does not exist a single SHG, which pursues economic activity after passing Grade-II. In the top ten blocks the relevant percentage is higher than 40.

- However, sufficient inter-block variation exists and Mathurapur-I (81.25%) tops the list followed by Diamond Harbour-II (61.25%).

Performance of the blocks viewed in respect of percentages of women SHGs formed is very good.

- The relevant percentages in the majority of blocks are higher than 60. Basanti (69.64%) tops the list. However, we get a somewhat mixed result considering the block performance on the basis of last indicator.

- In eleven out of twenty nine blocks there does not exist a single women SHG, which carries out economic activities after completing Grade-II evaluation. These are Bishnupur-I, Sonarpur, Bhangar-I, Bhangar-II, Falta, Mandirbazar, Canning-II, Basanti, Joynagar-I, Mathurapur-I, and Kultali.

- Of the remaining eighteen blocks, Patharpratima (100%) performs the best followed by Magrahat-I (93.33%) and Namkhana (87.50%). In fact, instead of considering the cumulative figures of such groups up to 2007, if we look at their inter-temporal performance in this regard (Table 26A2), we notice quite interestingly that in majority of these blocks there has been a considerable rise in the number of such groups since 2005.

---

5 This is definitely a depressing result but not an unexpected one, given the amount of hardship the poor and not-so-educated women are subject to since inception of the group till setting up a micro-enterprise. Sometimes, after passing Grade II test, a group may be denied loan if its past records of loan repayment are not good. Economic activities at this stage are to be carried out as a group and not by individual members. For successful result in this regard the group members must act together.

Source: Same as in Table 8.26A
The BORDA Rank, judged on the basis of ranks of all the indicators mentioned so far designate the better and poorly performing blocks. Quite a number of blocks performing consistently better in respect of majority of the indicators; figure in the better performers of BORDA Rank. These are Namkhana, Bishnupur-II and Patharpratima among others.

The functions of SHGs analyzed so far are satisfactory. There is however, room for further improvement in some cases, particularly in respect of pursuing economic activities after passing Grade-II evaluation. It is only then we can say that the basic objective of SGSY viz., empowering the poor people, the women in particular, through formation of SHG, has been fulfilled.

8.6 Summary and Conclusions

In this chapter, an endeavour was made to assess three distinct facets of gender and development in the district of South 24 Parganas. Before we conclude and speak about policy interventions it seems worthwhile to present section-wise major findings. It is to this that we turn next.

8.6.1 Summing up

8.6.1.1 Gender and Work Participation
- Female work participation rates are quite low in all three regions. Region-III, it may be mentioned, emerges as the best performer in 1991, in respect of overall (i.e. main+marginal) female work participation rates and work participation rates for persons as a whole, mainly due to the performance of blocks like Namkhana followed by Gosaba and Patharpratima.
- While overall work participation rates rise in 1991-2001 mainly due to a rise of such rates in for the marginal category, overall female work participation rates increase owing to a rise in such rates in main category in a number of blocks and in marginal category in all blocks.
- Gender-gap in work participation rates as measured by female to male ratio of such rates is alarmingly high in all the regions. Here also Region-III, in particular the above-mentioned three blocks, performs the best. During 1991-2001 such ratios rise considerably in all three regions, implying thereby a substantial fall in gender-gap in work participation rates.

- Disaggregating further it is noticed that the relevant ratios rise in main category (where these ratios are as such considerably low) and fall in the marginal category (where these ratios are usually very high).

8.6.1.2 Gender and Health Care
- Region-I emerges as the best performer followed by Region-II evaluated on the basis of safe motherhood criterion in delivery reports. However, in majority of the blocks in Region-III, where percentages of home deliveries are very high, at least 60 % of such deliveries are performed by trained birth attendants.
- IMR is least in Region-I and highest in Region-III. Here also Namkahana in Region-III shows the least value of IMR for both genders.
- Percentages of fully immunized
children in the age group below 1 year vary around 25. Though these percentages for female children are lower than corresponding percentages for male children in majority of the blocks, the gender gap is not significant.

- So far as the percentages of SNP beneficiary mothers and children in age group viz. 0-6 years are concerned, Region-I is the best performer. Among the blocks, Thakurpukur-Mahestala in Region-I, Diamond Harbour-I in Region-II and Namkhana, Gosaba and Kakdwip in Region-III are the better performing ones. In a number of the blocks percentages of female beneficiary children (age 0-6 years) are higher than the corresponding percentages of their male counterparts.

- Region-I, emerges as the best performer when we consider percentages of children in age group viz. 0-6 years by nutritional status. It exhibits highest percentages of normal children to total children weighed and least percentage of malnourished children to total children weighed. However, in case of normal category, percentages of female children are smaller than the same of male children while in case of malnourished category it is the other way round. In fact, percentage of female children to total children is least in normal category and increases with a rise in grade in malnutrition category — a fact, which clearly indicates gender disparity in respect of nutritional status for children in 0-6 years.

- Gender inequality is not found to exist for health care of children below 1 year.

8.6.1.3 Gender and Educational Attainment

- Region-I is the best performer in terms of literacy rates of persons, males and females and gender gap in such ratios. During 1991-2001 gender gaps in such rates decline in all three regions, the intensity of decline being most pronounced in Region-III.

- Majority of the blocks in the groups of both better performers and poor performers, evaluated on the basis of equally distributed equivalent index on literacy in 1991 and 2001, remains the same. The better performing blocks in both periods are Thakurpukuar-Mahestola, Budge Budge-I, Namkhana, Sagar and Bishnupur-I.

- During 2001-2007, we find that gender ratios of enrollment rise and the same of dropout fall in majority of the blocks.
in the age group viz., 5-14 years, implying thereby an improvement of the attendance of female children relative to male children in the above age group.

**8.6.1.4 Women and Vulnerability**

- The total number of IPC CAW cases in the district over the periods 2000 and 2003 show a distinctly rising trend in crimes against women with South 24 Parganas leading among the districts both in terms of absolute numbers and in relative terms.
- The composition of crimes in the districts is biased towards post marital violence accounting for more than half of the total crimes in 2002.
- Within South 24 Parganas there is tremendous interregional variation in overall crime rates as well as in CAW. On an average number of violent crimes decreases as we move away from Kolkata surroundings towards Sunderbans but the incidence of CAW is significant in the Sunderbans during 2005 - 2007.
- There is a strong relationship between the occurrence of STI and the extent of trafficking and migration.

**8.6.1.5 Gender and Empowerment**

- SC/ST women are better represented compared to general women in both the Gram Panchayat and Panchayat Samiti, particularly in the former.
- The numerical strength of women pattadars is praiseworthy for the district as a whole and for a few blocks.
- Vocational training under KSY seems to have a good potential for income generation, if properly implemented.
- Performance of SHGs is while commendable, leaves room for much more to be achieved.

**8.6.2 Concluding remarks**

The extent of gender disparity in the process of human development in South 24 Parganas is alarming, but seems to have been declining over time, in respect of work participation and educational attainment. Such a conclusion cannot be drawn in regard to health care provision due to non-availability of data over time. However, one point is very clear. Region-III, the otherwise backward region, which deserves policy interventions most, emerges, despite the inter block variation, as the best performer in terms of work participation and shows considerable improvement in regard to educational attainment over time.

No doubt, the nature of crime and violence against women as revealed in different forms is a matter of great concern and the task of eliminating these types of problems
must be at the forefront of sustainable development strategies. Though several NGOs have already been working to combat this problem, there must be a strong coordination among them, the Civil Society and the Panchayat to get an effective result in this regard.

And the ray of hope is that there are several programmes and schemes of the government launched in recent years, which aim to integrate the marginalized group, especially the poor women and the adolescent girls into the development process, by making them economically independent, helping them to take part in decision making and thereby empowering them gradually. We should not forget that empowerment is a process and it has already begun in South 24 Parganas as envisaged in the functioning of the NGOs, various non-formal educational institutions, the DRDC and most importantly the District ICDS, which has tremendous potential and if vested with more responsibilities, can change the lives of girl children and adolescent girls for the better. However, to maintain pace and ensure balanced development of the entire population and improvement in quality of life, proper government intervention and effective policy implementation are necessary in crucial areas, notably education, health and empowerment.
Sundarbans and the remote Islanders

9.1 Introduction

The present day is seeing economic integration on an unprecedented scale. Regional economic activity is being largely driven by markets outside and national economies are being increasingly dovetailed into the world market. Such rapid integration is undoubtedly helped by the revolution in information technology which drastically reduced the transaction costs that till recently had prevented high degree of local specialization. In recognition of the potential of such integration towards reducing world poverty, the World Development Report (WDR 2008) has advocated the integration of local agriculture with world market. This can enable subsistence farming to diversify into High Value Crops (HVC) which are often labour-intensive in production and remunerative to poor farmers. But being perishable in nature, such diversification requires establishment of modern supply chain as a precondition. Realization of this potential is being fostered by a concerted effort of various agencies, led mostly by the government. The provision of infrastructure like transport, power, irrigation as well as education and health are essential for such integration of local economies into the broader outside market that brings changes in local production pattern and throws up new earning opportunities for the local stakeholders. India, making strides in the economic front today, is experiencing such changes
in many of its parts. Rural life is breaking its inertia and coming to terms with the pace of urban life. The changes are brought about by increased interaction with urban centers through improved transportation and communication, and penetration of media into rural corners. Rural India is aspiring for more entitlements - aspirations that may not be distant dreams.

Yet some pockets of isolation remain. For some of them, the main cause of isolation is geographic. Most part of the Indian archipelago named Sundarbans, though situated close to Kolkata – the largest metropolitan city and commercial hub in eastern India – is remote and largely isolated. Due to the topographical specificities of the region – part of world’s largest mangrove delta region – Sundarbans is not holding a promise of bridging this distance in the near future even with today’s technology and engineering progress. The region consists of 102 islands out of which 54 are inhabited. The remoteness of the area is amply understood by the fact that in 4500 sq.km. inhabited areas, there is only 42 km. of railway line and about 300 km. of *pucca* road network. The only means of communication between the islands is through the waterways which is poorly organized and people have to depend on mechanized private boats.

Still the area is home to over 3.9 million people. It is spread over 13 administrative blocks out of 29 in the district of South 24 Parganas. Human development of the district loses its relevance if these islanders are left out. But a model of rural development successfully executed elsewhere, might not be applicable in Sundarbans due to problems specific to this region with special geo-climatic characteristics. It calls for a deeper insight of the social and economic life of the people of Sundarbans – and this chapter tries to capture a glimpse of that.

### 9.2 Sundarbans and the District

Sundarbans is the world’s largest prograding delta region that spreads over India and Bangladesh covering around 25,500 sq. k.m. The Indian part is approximately 9,630 sq. k.m. The Indian part of Sundarbans is not confined to one single district. Sundarbans also covers 6 administrative blocks of the adjacent North 24 Parganas district, besides 13 blocks in South 24 Parganas.
The socio-economic profile of Sundarban’s inhabitants and the bottlenecks to their development are very similar across the two districts. In recognition of it, the Government of West Bengal had set up the Sundarban Development Board in 1973 under the administrative control of Development & Planning Department for a comprehensive development of the region. With further emphasis on the development of this region, a new Department of Sundarban Affairs was created in 1994 and Sundarban Development Board was placed under its administrative control. With such a focused administrative approach towards overall developmental needs and specific problems of the region, it is difficult and often unwarranted to discuss Sundarbans only partially, confining within the administrative boundaries of South 24 Parganas. The introduction to Sundarbans—its climate, ecology and history cannot be
described within this district limit. However, being part of the District Human Development Report, the data regarding the socio-economic profile of the region, as reported in this chapter, are based on this district’s share of Sundarbans.

9.3 The Location and Physiography

The Indian Sundarbans is formally demarcated by River Hooghly in the west, Bay of Bengal in the south, Rivers Harinbhanga and Raimangal in the east (marking the international border between India and Bangladesh) and the Dampier-Hodges line in the north. The last one is an imaginary line, passing through 24 Parganas South and North districts, which indicates the northern-most limits of estuarine zone affected by tidal fluctuations.

The Sundarbans along the Bay of Bengal has evolved through quaternary (began about 2 million years ago and extends to the present) sediments deposited mainly by the mighty river Ganges, Brahmaputra, Meghna and their numerous distributaries. The building up of this estuarine area is consequently not complete. The mangrove-dominated delta is a complex ecosystem comprising one of the three largest single tract of mangrove forests of the world. The physiography is dominated by deltaic formations that include innumerable drainage lines. The Sundarbans’ floor varies from 0.9 m to 2.11 m above sea level. Tidal saline water, pushed into from the Bay of Bengal, alternately drowns and exposes the islets twice a day throughout the year. The average tidal amplitude in the estuaries of the Sundarbans ranges from 3.5 m to 4.0 m. The highest fluctuations in the water level are generally experienced in August - September when the highest tide level attained is in excess of 4.0 m. Most of the low-lying inhabited island sections are lower than the average tide level of the surrounding rivers.

Presently Sundarbans has a forest cover of 10,200 sq. km. shared between India and Bangladesh. India’s share of this forest area is around 4,200 sq. km. Indian Sundarban also includes around 5,400 sq. km. area outside the forest cover that includes inhabited lands along the north and north-western boundary of the forest.

Climate of Sundarban

- Annual average Maximum Temperature 35°C.
- Average humidity is about 82% which remains more or less constant due to the region’s proximity to the sea.
- Average annual rainfall 192 cm out of which 75% is received during June to September.
9.4 Ecological Significance and Biodiversity

The Sundarbans is rich in biodiversity and the biotic factors here play a significant role in physical coastal evolution and for wildlife. It has significant ecological implications for marine life and livelihood of coastal communities for a large part of south-east Asia. The mangrove vegetation itself assists in the formation of new landmass and the intertidal vegetation plays an important role in swamp morphology. The Sundarbans includes 26 true mangrove species, 29 mangrove associates, and 29 back mangrove species of 40 families and 60 genera.

In terms of faunal endowment Sundarban is famous for Royal Bengal Tigers. It is the only mangrove forest in the world that hosts tigers. It is also the single forest tract where the largest number of tigers is found. As per December 2001 census, the number of tigers in Indian Sundarban is 271. It is also home to a good number of globally endangered animals like estuarine crocodile, fishing cat, Gangetic dolphin, olive ridley and green sea turtles etc. Several bird species are found including a large number of migrants from the higher latitudes that visit the area in winter. Numerous species of phytoplankton, fungi, bacteria, zooplankton, invertebrates, molluscs, reptiles, amphibians and mammals are also found here. Species composition and community structure vary from east to west, and along the hydrological and salinity gradients. All these make Sundarban a biodiversity hotspot and its conservation is a global concern. Its conservation is closely monitored by the Government of India and that of the state of West Bengal.

### Faunal Diversity in Sundarban

- Vertebrate Species = 481
- Hemichordate Species = 1
- Invertebrate Species = 1104
- Protozoan Species = 106
- Mammals = 58
- Birds = 248
- Reptiles = 55

### Species that gone extinct in the last hundred years with human invasion

- Javan Rhino
- Wild Buffalo
- Barking Deer
- Swamp Deer
9.5 History of Human Settlement

An understanding of the region’s social fabric is necessary for an optimal development strategy. This calls for a brief introduction to the history of human settlements in the region. The present population influx in the region is fairly recent and does not involve a long tradition of rulers, landlords, intermediaries and class exploitation on the scale that mainland India had witnessed for thousands of years.

Some scattered historical findings in the region bear solid evidence that the area had been populated even at the time of Asoka (273-232 BC), though the evidences so far fail to add up to a comprehensive account of continued civilization in this delta region. However, it is well established that due to a series of natural calamities the region was gradually losing its population during the Middle Ages. Eventually, after the invasion of Portuguese and Arakan pirates in the waters of the delta, the area was depopulated for all practical purposes. The forest reclaimed the previously inhabited area and when the British East India Company set up their headquarters at Calcutta in 1757, it was at the edge of the forest.

9.5.1 Recent History

The recent history of human settlement in the Sundarbans dates from the treaty of 1757 signed by Mir Jafar, through which the lands of undivided 24 Parganas, then practically depopulated, were ceded to the East India Company. Clearing the forest and introducing human settlement in the area was done in a planned way under the British rule where the motivation solely was increasing revenue collection. The present settlements originate from the plan conceived by Clod Russell, then Collector General in 1771, whereby the forest land had been divided into plots to be leased out to prospective landlords.

Clearing of forest effectively started from 1781 by Tillman Henkel, then magistrate of Jessore district. Thereafter the forest line was being continuously pushed back from its western and northern fronts. Initially forest was cleared mostly in its northern part and by 1873 the blocks of Hasnabad, Bhangar, Haroa, Hingalgunj, Minakhan (N 24 Parganas) and Canning, Joynagar, Mathurapur and Sagar (S 24 Parganas) had been fully or substantially cleared of forest. In this first phase of unregulated deforestation, much of the
revenue came from forest products including timber. However, it was gradually declining and the need for conservation was voiced from within the administration. Consequently, the first initiative for conservation was also mooted under the British rule.

In 1875-1876 the government declared the un-leased forest area as reserved, and placed them under the jurisdiction of the Forest Department. Still, the area which was already leased out by that time continued to attract population at the cost of the forest. Between 1873 to 1939, much of the interior blocks of Sandeshkhali, Kakdwip, Patharpratima, Basanti, Kultali and Gosaba (all under S 24 Parganas) had been cleared of forest to make room for human settlements.

The forest boundary took a further

Sir Daniel Hamilton and his Island Experiment

The forested islands of Sundarban could be populated in the early days only by successful community cooperation. This was pioneered by Sir Daniel M. Hamilton who is a legendary figure among these islanders even today. Hamilton was a Scottish businessman and made a good fortune out of his shipping business in Calcutta. After retiring from the business, he wished to implement his idea of cooperative community living in a self-sustained way in the deltaic islands of Sundarbans. In this pursuit he took lease of three uninhabited islands Gosaba, Rangabelia and Satjelia (now under Gosaba Block) in 1903. He then formed *Bengal Young Mens Zamindary Co-operative Society* which also had support from the government. To make these mud-flats and forest land habitable, a huge labour-input was required. Sir Hamilton brought labourers from the mainland who were given reasonable provisions for livelihood for an initial period. They were required to erect embankments all around the islands to protect the land from saline water before agriculture could be started. Besides, he established free schools and dispensaries and built freshwater ponds for rainwater harvesting.

All these efforts were directed towards establishing a self-sufficient island economy with exchange between the islanders. To finance the developmental activities and facilitate the local commerce, he introduced what came to be known as *Gosaba Currency*. The Estate Office of the Society acted as the central bank in this respect. Hamilton’s own money of eleven hundred rupees (coins – legal tender) acted as the base on which he issued his own notes. It is interesting to note the words which appeared on his note issue. On one side it stated:

“Sir Daniel McKinnon Hamilton promises to pay the Bearer, on demand, at the Co-operative Bhundar, in exchange for value received, one rupee's worth of rice, cloth, oil or other goods.”

(Signed) D. M. Hamilton.

Written on the back of the notes were more interesting words – which reflects his philosophy behind this island-experiment:

“The value received in exchange for this Note may be given in the form of bunds constructed, or tanks excavated, or land reclaimed or buildings erected or in medical or educational service. The Note may be exchanged for coin, if necessary, at the Estate Office. The Note is made good, not by the coin, which makes nothing, but by the assets created and the services rendered. The Note is based on the living man, not on the dead coin. It costs practically nothing, and yields a dividend of One Hundred percent in land reclaimed, tanks excavated, houses built, etc. and in a more healthy and abundant LIFE.”

These notes were willingly accepted by the workers on the island and villages were built, each with its school, and eventually what was formerly an uninhabited area achieved a considerable population which could sustain itself on those remote islands.
beating after India’s independence due to the Partition of Bengal. Between 1951 to 1971, this area was forced to accommodate a huge influx of refugees from East Pakistan (Bangladesh) and some forested islands were cleared for human settlement. Presently, out of 102 islands in the delta region, 54 are populated while the remaining 48 are reserved with forest cover.

In the initial years of settlement, clearing the marshy mud-flats and making them habitable was an act of extreme hardship in a hostile environment. The lease-holders, who were mostly upper caste moneyed Hindus, had lured the poorest tribal people from Chhottanagpur, Ranchi and Hazaribag region in the Indian mainland to settle in their area. They were lured through packages of initial provisions and some cultivable land for their own. Also the area experienced migration of poor people from the adjoining district of Midnapur in the west, which is a coastal district with a history of repeated cyclone disasters. Finally, a significant section of local population consisted of migrants from neighbouring districts of Bangladesh in the east.

**9.6 Sundarban Administration**

The developmental activities of around 5400 sq. km of populated area within Sundarban is financed and supervised by the Sundarban Developent Board under the Department of Sundarban Affairs in the state administration (Government of West Bengal). However, for reaching a harmony between development and conservation, the Government of India constituted the Sundarban Biosphere Reserve (SBR) in 1989 which includes the human settlements as well as 4200 sq. km. of reserve forest area headed by Chief Conservator of Forest Divisional Forest Officer (South 24 Parganas) who is in-charge of the rest of the reserve.

**Composition of Protected Area**

Nearly 40 per cent of the reserved forest area has been brought under Protected Area network that includes:

- Sundarban National Park (1330 sq.km);
- Sajnekhali Wildlife Sanctuary (362 sq.km);
- Lothian Wildlife Sanctuary (38 sq.km); and
- Haliday Wildlife Sanctuary (6 sq.km).

Out of this total recorded forest area, 55 per cent is under land vegetation cover and the remaining 45 per cent is under water body/ inter-tidal zone.
9.7 Demography

In Sundarbans, the coexistence of human settlements and reserve forest is unique in the sense that unlike other forests, there is no human settlement within the reserve forest area. The human habitat and the forest are always separated by rivers. Along the north and western boundaries of the reserve forest, under the Biosphere Reserve, human settlements can be classified into two parts depending on their geographic location. Some of them are now parts of the mainland which are connected by roads and having other infrastructural facilities typical of their rural counterparts in India. Under South 24 Parganas, the areas under the Administrative Blocks of Canning, Joynagar, Mathurapur, Kakdwip and Namkhana fall almost entirely in this category. The people living in these areas are not in close proximity with the forest and their living conditions and livelihood options are similar to that of other areas in the district.

But the Blocks of Basanti, Gosaba, Kultali, Patharpratima and Sagar, together accounting for around 40% of total area in the district, call for a special understanding of the people, their livelihood and threat perceptions. They are almost entirely detached from the mainland and live under much different conditions unmatched in the rest of India.

These are people living in islands on the fringes of Reserve Forest. The islands often face the forest on the other side of the separating river. The history of these island settlements does not date back to more than hundred years. Almost none of these islands has any electricity connection and other infrastructural facilities like transport and communication. The settlers initially lived mostly on agriculture with some viable amount of reclaimed cultivable land for each household.

After independence, these islands saw a steady influx of migrants from adjoining districts in mainland. Specially, the

**History of Forest Conservation in Sundarban**

1875-1876: The British government rolled back the policy of leasing out forest land and brought the remaining forest under the jurisdiction of Forest Department.

1926: The remaining forest was declared as Reserve Forest, boundaries of the Reserve were fixed.

1973: Sunderban Tiger Reserve was constituted by GoI under Project Tiger scheme

1987: Sunderban National Park, forming the core area of Sunderban Tiger Reserve, received recognition as World Heritage Site, by UNESCO

1989: Sunderban Biosphere Reserve was constituted by Government of India (GoI) to establish a formal mechanism for coordinating and integrating diverse activities of conservation and harmony between man and environment. Sunderban Tiger Reserve became a part of it.

2001: Received the recognition of UNESCO, under its Man and Biosphere (MAB) programme.
partition of Bengal resulted in an influx of refugees from erstwhile East Pakistan (now Bangladesh). The late-comers were left with little or no landholding and fell back on the forest for its products and on the rivers for fish and crab. Also, with subdivision and fragmentation of landholding through generations, the landed households gradually turned marginal and could hardly sustain with agriculture alone. Consequently, fishing became the second most important occupation for these islanders. The heavy dependence on forest for the landless or marginal households is also perceptible in absence of any power-driven industry in these islands. This background also explains the spatial distribution of population within these islands. Households which directly depend on forest and rivers (mostly landless and marginal), are concentrated on the banks of the rivers bordering the forest. The landed households are mostly placed in the interiors or towards the mainland.

Overexploitation of forest and river (fish) resources is already showing in terms of decreasing yield. For islands in the periphery of the reserve forest, there is no urban centre nearby to market their product through crop diversification. These isolated island settlements are brimming over their sustainable level of population with limited livelihood options. As a result, recent years have seen an increasing flow of out-migration of local youth from these islands into different parts of India. Almost three quarters of total Sundarban population of 3.76 million (Census 2001) live within the South 24 Parganas district. Also, out of the district’s total 6.9 million people (Census 2001), 40% belong to Sundarbans. The population intersection between Sundarban and South 24 Parganas is around 2.8 million spread over 730 villages, out of which
nearly 30% belong to the isolated islands. Going by the Census estimates (2001) for the district, the population density in Sundarban is approximately 934 per sq. km and the number of females per thousand males stands around 946.

The settlement history in Sundarbans explains the presence of a relatively larger proportion of lower-caste people in this region. Nearly 36.5% of its population belong to SC/ST category compared to the state average of 25.6%.

The remoteness and isolation of most parts of Sundarban left the region crippled in terms of infrastructural provisions. The development potential for a region is closely linked with such provisions. The relative underdevelopment of Sundarbans can largely be explained by its poor infrastructure. In the 4,500 sq.km of inhabited area, there are only 42 km of railway line and about 300 km of metalled road network. Almost all the islands are devoid of any conventional electricity supply. Governmental effort to provide solar energy systems at subsidized rate has also not been much successful because of the very little purchasing power of the islanders.

At least five of the thirteen Sundarban blocks are entirely or mostly constituted by islands which do not have a direct road-link with the mainland. These are Gosaba, Basanti, Kultali, Patharpratima and Sagar.
Among them, the first four are on the boundary of the reserve forest. For these blocks the only means of communication with the mainland as well as with other islands is through long journeys through river channels. Such transport is not well-organized and people have to depend on the private mechanized boats which are often overloaded while negotiating treacherous waters. Few islands have pucca/well-maintained jetties. Few islands have inland transport in the form of cycle-van, while others do not have any mode of transport at all.

Sagar, though itself an island, is somewhat different from the other four island blocks. While other island blocks are close to the forest and surrounded by rivers carrying saline water, Sagar is located at the mouth of the mighty river Hoogly which carries freshwater. So, the livelihood options are marginally different in Sagar. Directly forest-dependent poor people are not seen in Sagar. Also, this island is visited by over a million pilgrims from all around India for the annual occasion of Sagar-Mela. This religious tourism had helped Sagar to develop some infrastructure on the island over time. Other Sundarban blocks have been gradually linked with the mainland over time and the infrastructural provisions improved. This resulted in more livelihood options for the population of these blocks. But even these not-so-remote Sundarban blocks compare very unfavourably in terms of various infrastructural indicators when compared to the rest of the blocks in the district.

The relative disparity in infrastructural provisions in Sundarbans can be amply seen from Table 9.1 which directly compares the island blocks with the rest of Sundarban and with the rest of the district in terms of four basic indicators.

of infrastructure. It shows the sharp deficit in infrastructural provisions in Sundarban region and even across blocks within it. It undoubtedly explains the region’s relative impoverishment. It also points out the priorities towards which any planned effort towards the region’s development should be directed to.

9.9 Livelihood

Part of Sundarban population lives within the mainland and their livelihood pattern are similar to the rest of the rural population in the district. It is the island villagers whose way of living and entitlements are considerably different from that of their mainland counterparts. The livelihood options in these remote islands are indeed very limited till date.

Typically in the delta region rain-fed, single-crop agriculture and fishing are the two main sources of livelihood. Nearly 95 per cent of the population primarily depend on agriculture. About 50 per cent of agriculturists are landless labourers. For the blocks bordering the reserve forest, during agricultural lean season, substantial part of the population depends on forest and river resources. During April - May, some people enter the forests with permits for collection of honey and bee-wax which is partly purchased back by Forest Department. Besides, some households entirely and some partially engage in catching fish and crab in the rivers and creeks. Both of these operations are perceived to involve considerable danger due to tigers in the forest and crocodiles in the rivers. It can be perceived that these people directly depend on the forest as a last resort for their livelihood and are almost always very poor with nil or unsustainable landholding.

Income from these occupations is often supplemented by catching “meen”, the local term for shrimp seedlings. The spawns of tiger prawn, which are hatched in these saline waters are much in demand by the inland prawn farms and fetch hard cash for the poor. A large section of women and children from poor households catch these tiny prawn seedlings with fine nets, which are then sold to ‘bheries’ (water bodies for growing fish) to grow in brackish water. The estimated value of shrimp trade from the delta, including exports, is worth over Rs.100 crores. However, the real beneficiaries are mostly the middlemen and exporters.

Cultivation of crops, mainly paddy, is mostly for self consumption. This applies even for vegetables. The remoteness of
island blocks and absence of any urban market within a viable distance explains this feature.

Though barter exchange is not very predominant in the village, the majority of intra-village transactions are carried out by informal credit system. Discussion with local traders suggests that the island-villages are net importers of agricultural commodities while the major means of net cash inflow are fishing, prawn-fry collection and remittances from outside.

It is recognized that nature-based tourism in Sundarban has a great potential to generate local earning opportunities. However that potential is yet to be realized to any significant extent. This is mostly because of the lack of infrastructure such as proper transport facilities and electricity. Tourist arrival in Sundarban is presently concentrated almost entirely during three winter months. Moreover, lack of information dissemination and shortage of good accommodation facilities force most of the visitors to avail some ‘package tours’ which are mostly operated by outside agencies. The residents of the island villages have little opportunity to take part in such tourism-related business. It should be noted in this connection that big corporate investment has been proposed to develop tourism in Sundarban, but this is aimed at catering to the wealthy visitors with all modern hospitality provisions. Apart from its questionable impact on the fragile mangrove ecosystem, such initiatives will not have the support from the local villagers in these islands as they could see little scope to become stakeholders in such big corporate initiatives. What is required is a comprehensive plan for a spatially dispersed eco-tourism development which necessarily integrates the island villagers as stakeholders.

Empirical analysis of available secondary data (Census 2001; Rural Household Survey 2005, Office of the District Magistrate of South 24 Parganas) underscores the point that the people living in the island blocks have significantly lesser livelihood options compared to the rest of Sundarban blocks. Some interesting findings are as follows

This reversal of distribution of households across the two types of blocks for the two lowest-ranking rural asset holding class is not paradoxical and indeed tells something about the local livelihood opportunities in the two sub-regions within Sundarban. The islands came up with settlers practising agriculture which was practically the only livelihood in the initial phase. Later on, fishing and more lately shrimp-farming and prawn-fry collection emerged as significant alternative livelihood options. However, lack of transport and electricity resulted in very little scope for development of commerce or rural informal manufacturing sector. Whatever little scope of non-farm livelihood exists in these islands cannot sustain a large landless population. On the other hand, Sundarban blocks which are connected to the mainland with improved infrastructure could accommodate a larger share of landless population through many more non-farm livelihood options. It is perceivable that most of the landless refugees who took shelter in Sundarban blocks in later days, located themselves in the connected blocks rather than in the isolated remote islands.

Also, in the absence of alternative livelihood options, agricultural land is held by rural households as valuable assets – even if its size became economically non-viable. With subdivision of landholdings through generations, all of the agricultural households in the region must have experienced dwindling size of average landholding. However, in a mostly rain-fed agricultural region producing a single crop, irrigated land of less than one acre or non-irrigated land of less than two acres can hardly sustain a household. With alternative earning opportunities, such non-viable landholdings are expected to be sold off and the household is expected to shift to other non-farm activities. But in the island-

blocks of Sundarban, very limited alternative earning opportunities must have prompted a large percentage of households to retain their non-viable marginal land. Clearly, these households sustain themselves by supplementing their earning from other locally available part-time occupations – which often involves prawn-fry collection and fishing. These are in turn gradually reducing the sustainability of this delicate mangrove ecosystem.

The conjecture can be substantiated by empirical observation if we look at the occupational pattern of households across the two categories of blocks in Sundaban. Looking at Table 9.3, it is evident that in blocks which are connected to the mainland, larger percentage of the total local workforce is sustained by all types of non-farm livelihood options.

9.10 HDI in Sundarban

Earlier chapters in this report had dealt with the components of Human Development Index (Standard of living, Health and Education) in details at block level and the Sundarban blocks were together considered as Region III in that analysis. It was already noted that Sundarban, as a region in that three-region segmentation of the district, is the most backward in terms of most of the components and the overall HDI. It will be redundant to repeat the component-wise analysis of HDI for all the Sundarban blocks again. Instead, a brief introspection into the pattern of intra-regional disparity within Sundarban would be meaningful, based on the block-wise indicators already reported in earlier chapters. It would drive home the relative deprivation of island blocks, a point that has also been underscored in the previous sections of this chapter. However, it is interesting to note that the five island

blocks in Sundarban compare favourably with the rest of the region in terms of some basic provisions for primary education. This is evident in Table 9.4. At least part of this favourable score of the island blocks in terms of educational achievement can be related with their history which saw Christian missionary activity in blocks like Gosaba. Also, establishing primary education centres that cater to local population in an island is a more economically feasible social investment than building road-links with mainland or provision of electricity. Accordingly, these island blocks show little difference in terms of educational achievement indicators like enrollment and literacy, when compared to the rest of Sundarban blocks.

However, the score of the island blocks in terms of primary health provisions is not up to the mark. Table 9.5 underscores the relative deprivation of the island blocks even within the Sundarban region, on this count.

Turning to some standard of living indicators, from Table 9.6, it can be readily seen that the island blocks are lagging behind compared to the rest of Sundarban blocks. The table summarizes their status across five such indicators which can be considered as basic requirements for human living.

The combined score of the island blocks, across the three components of human development as well as the aggregate Human Development Index, thus compares poorly with the rest of Sundarban, which in turn is the relatively deprived region within the district of South 24 Parganas. Table 9.7 summarizes the indices across this categorization of blocks. Each of the indices has a highest possible value of unity. Each of the 29 blocks in the district is also ranked according to each of these indices with ‘1’ standing for the highest and ‘29’ standing for the lowest rank. The ‘average rank’ is the average of such ranks for blocks combined under the three categories. This average rank will also help bringing out the relative differences across the three categories.

As was indicated in earlier analysis, it is clear that there is a great deal of heterogeneity in terms of provisions and achievements within the blocks of Sundarbans. The five island blocks are laggards in terms of indicators of human development, except primary education. The average rank of these blocks in terms of other indicators as well as overall HDI is more than 23 out of 29 blocks in the district of South 24 Parganas. This calls for a differential treatment of these island blocks in a comprehensive developmental plan for this region. A uniform distribution of plan- resources across blocks in Sundarban will fail to take care of the inter-regional disparity.

9.11 Threats to Sustainability

9.11.1 Climate Change Impacts

It is scientifically established by this time that the greatest threat to the future of Sundarbans is posed by the continued Global Warming and the resulting sea level rise. Past century saw an increase in average global temperature by 1°C. At the present rate the temperature is slated to increase by another 3.5°C in next fifty years. The melting of polar ice cap is a direct and certain fallout and much of the coastal low lying areas in the world is threatened by possible submersion. Along the Indian coastline, the sea level is estimated to be rising at the rate of 2.5 mm per year. Research from Jadavpur University’s Centre for Oceanographic Studies has estimated that along the eastern coast of India, this rise is even faster at a rate of 3.14 mm per year. It is estimated that by 2020, around 15% of Sundarban area will be submerged and an estimated 70,000 people will be ‘environmental refugees’. The threat is evident from the latest Geographic Information Systems (GIS) report which showed that in the past 70 years, 220 sq km of forest land had been submerged.

Apart from sea level rise, more immediate threat to human lives and livelihood can come from an increased frequency of cyclones and even super-cyclones. The area is cyclone-prone and historically these natural calamities came with devastating consequences for the islanders. With global warming and climate change, the frequency of such calamities is estimated to increase.

9.11.2 Anthropogenic Stress on Environment: Biodiversity Loss

Since the human settlements began in Sundarban under the British rule, a considerable loss in faunal diversity of the region has already taken place. Following a 1878 account, “Tigers, Leopards, Rhinoceros, Wild Buffaloes, Wild Hogs, Wild Cats, Barasinga, Spotted Deer, Hog Deer, Barking Deer, and Monkeys are the principal varieties of wild animals found in Sundarbans”. However, due to habitat degradation and ecological changes, some of these animals in Sundarbans became extinct during the last hundred years.

Another problem threatening the
Sunderbans’ mangrove ecology is the collection of tiger prawn seeds. Burdened by poverty, over two lakh people have turned to collecting tiger prawn seeds, using nylon nets, which are dragged along the river banks. In the process, apart from destroying mangrove seedlings and eliminating the possibility of a regeneration of mangroves along the river banks, at least 74 species of fish are also destroyed. Estimates by the Marine Biological Research Institute, 24 Parganas (South), revealed that in the process of collecting 519 prawn seeds, on an average 5,103.25 gm of other seed varieties that sustain different categories of fish are destroyed. Gradually, the food chain of this ecosystem is breaking down. The effect is already evident by a dwindling fish yield in the delta region. It has already threatened one of the principal livelihood options in the region.

Also, the ecological significance of the Sunderban mangroves is immense. Apart from serving as a shield against natural calamities, it checks atmospheric pollution. It has a seemingly unlimited capacity to absorb pollutants from both air and water. But a 2007 report by UNESCO has stated that a 45-cm rise in sea level (likely by the end of the twenty-first century, according to the Intergovernmental Panel on Climate Change), combined with other forms of anthropogenic stress on the Sundarbans, could lead to the destruction of 75% of the Sundarbans mangroves.

Tourism a Viable Option for Livelihood and Conservation?
– Research from an independent agency

Due to its importance as a biodiversity hotspot and World Heritage Site, there has been a substantial increase in research interest on various aspects of Sundarbans from various agencies and individuals. Some of the research findings are publicly available and can be used as a baseline for a comprehensive developmental plan for Sundarbans. One such recent study has been carried out by South Asian Network for Development and Environmental Economics (SANDEE, www.sandeeonline.org). The study primarily examines the contribution of tourism towards improving the livelihoods of the local people in a remote island village of the Indian Sundarbans (Working Paper No. 26-07).

The study found that with the arrival of visitors in an island village bordering mangrove delta forest, the local people spontaneously availed the opportunity to enter into various tourism-related service provisions. Majority of them belong to landless and marginal cultivator households, a profile similar to those who mostly depend on direct forest exploitation. The study found 78% of the local service providers/traders operate with either very small or no capital investment. Village households that could avail tourism-related earning opportunities are found to spend 19% more on food and 38% more on non-food items per capita compared to other similar village households. However, the study found that presently no village household subsists entirely on tourism-based income since tourism is extremely seasonal.

The conservation effect of tourism is perceptible as the proportion of forest-dependent households is found to be significantly lower among the participants. This is indicative of a substitution of forest-based earnings by tourism-related earnings. However, the study found little evidence of the percolation of tourism-related income to non-participating households through intra-village transactions. While the villagers’ overall perception of tourism is found to be positive, a significant section of villagers take cognizance of the growing income-inequalities resulting from tourism-based income. The study proposes a carefully crafted policy for promoting nature-based tourism with more room for local participation.
9.11.3 Threat from Embankment Erosion

The Sundarban islands are in their formation stage and were still young when they were forced to support human habitation and agriculture, before attaining the necessary height through the natural process of siltation. Without human interference, only a small part of these islands’ upper surface can keep above the surrounding saline water level at high tide. The salinity allows nothing but mangroves to grow on the soil. There is no possibility of growing food crops on such land unless it is kept out of reach of the river water for a considerable time and successive rainy seasons dilute the land salinity. This is why the settlements could take place only after surrounding each island with a sufficiently high earthen embankment that could withstand the daily onslaught of tidal waves. More than a century later, these embankments still stand as the chief defence and lifeline for the property and village economy in Sundarban.

Yet, these fragile acts of mankind are at the mercy of mother nature. Continuous erosion of these embankments are as real as their existence. The physical development processes along the riverbanks and coast are influenced by a multitude of factors, comprising wave motions, micro and macro-tidal cycles and long shore currents. The currents vary greatly along with the monsoon. These are also affected by cyclonic action. Erosion and accretion through these forces maintain varying levels of physiographic change whilst the mangrove vegetation itself provides a remarkable stability to the entire system. The practice of prawn-seed collection all along these embankments have largely wiped out the natural mangrove growth, exposing their base to the constant flow of water. The community cooperation among the islanders in jointly upkeeping this lifeline has weakened through ages and new institutional developments. As a result, each year, several of these islands routinely experience the loss of crop due to the breaching of embankments.

A Fact-Sheet on Embankments

The total length of 3,500 km of earthen river embankments and coastal dykes, along with 862 drainage sluices, are maintained by the I&W Department in the Sundarbans. Out of this:

- Length of River Embankment on Major Estuaries: 700 km
- Length of River Embankment on Medium Estuaries: 2,750 km
- Length of Sea Dyke on the sea coast: 50 km

Presently more than 2,000 km of this embankment network are without the necessary mangrove cover.
9.12 Saving Sundarban: Whose Responsibility?

This chapter has taken a closer look at the socio-economic fact-sheet within the Sundarban region. Empirical evidence overwhelmingly establishes the relative deprivation of the population on the islands, mostly in close proximity to the reserve forest. Priority must be given to such blocks to improve some of the basic infrastructural provisions like electricity and communication. Resources at disposal to the local authority are often limited and they usually flow to the area where maximum number of people can be served by a given amount of social investment. In remote islands, improvement in these provisions require a substantially larger cost relative to the number of beneficiaries. Seen from this local perspective, the backwardness of the island blocks of Sundarban can be logically explained.

Yet, neglecting these people may have global implications. It is fairly established by empirical research from different parts of the world that “poverty is the greatest polluter”. Poverty and underdevelopment of a region pushes the local poor to overexploit the surrounding natural resources. In Sundarban’s island blocks surrounding the forest, crippled infrastructure leaves the local poor with few alternative livelihood options, but to depend on the forest and the rivers. The World Heritage Site and a delicate ecosystem’s future sustainability is at stake. This fragile ecosystem renders valuable ecological services to a vast region in South Asia – replenishing the fish stock in the Bay of Bengal and maintaining the region’s biological balance. It is also home to many endangered species, the most famous being the Royal Bengal Tiger. All these ‘user-values’ and ‘non-user-values’ of Sundarban are not exclusive to the local population. So, national and global responsibility is also called for. Financial assistance to the local authority should logically flow from both national and international stakeholders, and should be directed to the priority locations within Sundarban, as is indicated by the discussions in this chapter.
The Way Ahead

The preparation of District Human Development Report for a district with multi-dimensional complexities like South 24 Parganas is a considerably complicated exercise in itself. Apart from its sheer size and large population, the varied topography with urban metropolitan living at one end of the district bordering Kolkata and people’s struggle for coping with very uncompromising nature at the other end in Sundarban makes the task a highly difficult one. The expectations of the people of different regions are different; the threats they face are entirely different from one region to another or for that matter even from one block to another. It is thus almost impossible to make policy recommendations at the macro level for the district as a whole.

It is expected that a Human Development Report would identify the problems associated with human development in the reference area and offer some suggestions towards rectifying those problems. In South 24 Parganas - a district characterized by heterogeneity - an ideal policy framework would require prescribing policies for each block separately, given the differences in the topography, threats, scope and aspirations of the people. The measures required for Thakurpukur-Maheshtala – an almost entirely urban block located on the fringe of Kolkata Metropolis – cannot be and should not be same as those required for Gosaba – a block comprising islands with no direct road connectivity to mainland. Unfortunately, such a disaggregated micro level analysis is beyond the scope of this report.

The objective of this concluding chapter is to reflect on some general guidelines that we hope will help the district in traversing the future path. This is an unenviable task, knowing fully well that without more detailed policy recommendations at the block level taking into account the characteristics and problems faced by each individual block, any general policy is bound to have limited impact on the human development of the individual blocks, at least in the short-term. To make this exercise a successful one, it is imperative to arrive at an integrated participatory coordinated plan of development of each different area, based on the general guidelines found in this report. An essential step in this direction is to ensure consolidation from the grassroot level.

Though a large section of people in
South 24 Parganas still depend on agriculture for their livelihoods, in the post-liberalization era agriculture has become relatively unremunerative after the gradual withdrawal of farm subsidies. This is particularly so in South 24 Parganas with majority of its agricultural land being monocrop in absence of proper irrigation facilities. The ground water irrigation that has been so successful elsewhere in the state did not succeed here because of high salinity. The lack of irrigation facilities also has limited the labour absorbing power of agriculture denying rural people very important employment opportunities. This needs to be taken care of immediately. Large amounts of rainwater run off to sea through different river channels during the monsoon, while in the Rabi season water for irrigation is scarce. A major irrigation project with large water storage tanks and interconnected network of canals can change the agricultural landscape of the district permanently – particularly for the mainland blocks. Rainwater can be stored during monsoon and later used during dry season, enabling multicropping and significant crop diversification. This would be a major step forward towards creating additional employment potential in agriculture as well as making agriculture remunerative.

Horticulture offers considerable potential for employment generation and productivity growth in the district. Bishnupur I and II blocks are well known for their nurseries. Guava and lichee of Baruipur, mango of Bhangar, watermelon of Kakdwip and Sagar, chilli of Patharpratima are widely known for their good quality. But absence of local processing industries and poor storage and marketing facilities due to lack of rural infrastructure sometimes lead to huge loss on the part of the cultivators. Development of infrastructure and promotion of local agro-based industries are required to provide the farmers with incentives to cultivate these crops. Amtala Food Park is one such initiative in the right direction. But, similar projects need to be promoted on an urgent basis.

Being a riverine district with almost a third of the population living in islands of the southern Sundarban blocks, fishing is a natural occupational choice for a large part of the population. Besides river and sea fishing activities carried out by a large number of fishermen, the district has had both saline and sweet water fisheries for a long time. But unfortunately, only about 40 percent of the area available for pisciculture in the district is presently being utilized for the purpose. This is a serious under-utilization considering the natural propensity and specialization of the people of the district in this particular
profession. This needs to be improved upon by providing appropriate incentives. Fishermen’s cooperatives may be formed and linked with other government sponsored schemes to provide these cooperatives with easy access to technology, bank loans and training for members. This has a very large employment potential in the district not just for male but also for female job-seekers. One such success story in the district is in the case of ornamental fisheries. Many self help groups in Bishnupur I and Bishnupur II blocks have very successfully taken up ornamental fishing activities with encouragement from the district administration. One advantage of fishing as a livelihood choice is that there is no dearth of demand. But care must be taken to develop appropriate infrastructure like refrigerated storage facilities and fishing ports for promoting sea and river fishing. In Sundarbans, women and children are involved in large numbers in prawn seed collection from the rivers for the inland fisheries. This is a very hazardous occupation with high degree of associated physical risk. Moreover, environmentalists have pointed out that this activity, if goes on unchecked, may seriously damage the marine biodiversity of Sundarbans besides eroding embankments of the islands rapidly. This is a very serious concern and needs to be addressed immediately, possibly by identifying a window within the year during which the prawn seed collection from the river would be legally prohibited.

Though South 24 Parganas is presently a predominantly rural district, it enjoys a strong manufacturing presence in the eastern bank of Hooghly river from Maheshtala - Budge Budge upto Falta. The growth of industrial output in the district has been higher than that of the state by a significant extent in the recent past. If infrastructure – particularly good roads and industrial power - can be properly developed, the district has the potential to become a very attractive destination for new industrial investment given its proximity to Kolkata. That the district has easy access to the main waterway of the state – the Hooghly river – can only help the matter further. Presently, the state of West Bengal is going through a process of industrialization. New investments – both domestic as well as foreign – are coming to the state. It is thus imperative that the advantages of the district are promoted aggressively to attract investment. Potential areas for industrial establishments need to be identified and developed as quickly as possible. Otherwise, a very good opportunity to alter the livelihoods of many may go begging.

Our analysis shows that beyond any
degree of reasonable doubt the standard of living in an area is determined by its infrastructure – both physical as well as financial. It is unfortunate that the district as a whole is lagging behind in this aspect. The state of infrastructure worsens as one moves farther away from Kolkata. This has increased the regional disparity in the quality of life. This requires immediate attention with specific geographical targeting for infrastructural development to properly utilize the limited resources available to the Government. Sundarban region, where the existing infrastructural facilities are in a precarious state must be given top priority.

The achievement of the district in education is encouraging. But there is no scope of complacency and much is yet to be done. This is the time to consolidate and to make sincere efforts to improve upon aspects that were not properly attended to. The achievement of the district in reducing illiteracy and promoting female literacy is commendable. But the gender gap is still alarmingly high for many blocks. Literacy rates for some backward pockets and for some underprivileged communities are still unacceptably low. Thus there is need of geographical, community-based targeting of literacy programmes. Gender friendly non formal institutions and literacy centres should be established to reduce gender gap in literacy.

The performance in school enrolment clearly gives a sign that the district in near future will achieve the target of universal enrolment. But drop out rates at all stages of education are alarmingly high. Female enrolment falls drastically when the age of marriage is approached. Thus there is need to provide some incentive to retain girl students. The system of mid day meal has well known positive impact on retention. Now that the programme is extended to the upper primary level, a positive impact on retention can be expected. Introduction of financial grant can be effective to retain girls at a higher level of education. The importance of female literacy in human development cannot be overemphasized. Increase in female literacy has significant positive impact on aggregate literacy, dropout, and on maternal and child health. The involvement of community and local Panchayat can be effective in reducing drop out of girl children.

Proliferation of educational infrastructure at the primary level is better compared to educational institutions at a higher level. Student teacher ratio and number of students per school increase substantially in secondary and higher secondary schools when compared to a primary school. Unavailability of college level infrastructure in the district is a well
known obstacle to higher education particularly in remote blocks of Sundarban. Thus along with consolidation of achievement at the primary level, proliferation of higher level institutions should be sincerely targeted. The quality aspects of education by improving physical infrastructure, full time teaching personnel should get attention.

Government programmes on education aim at improvement of educational scenario of the district. The successful running of adult education centres has resulted in eradication of adult illiteracy to a large extent in recent years. These programmes cannot be sustained if they are not linked with employment generation opportunities. Continuing Education Centres provide such employment opportunities. But there is need to converge the literacy programmes with other developmental programmes, particularly those geared towards employment generation.

The analysis of the health situation in South 24-Parganas shows that there is scope for considerable improvement in almost all areas. The existing health infrastructure in most blocks does not satisfy existing national norms. This creates a tremendous pressure on blocks where the local population relies heavily on public health facilities. A rather disturbing feature associated with public health in the district is that the reliance on public health facilities is low except in Sundarban. This particular feature indicates the lack of faith of the people in public health facilities wherever alternatives are available even if they are more expensive. In Sundarban, absence of private health facilities compel the people to flock to the state-run health centres. This is a very serious issue. Underutilization of public health facilities in a district like South 24 Parganas means a large wastage of public funds. To restore people’s faith in public health, measures towards quality improvement in public health centres are urgently required. These include manning of the health centres with doctors and trained para-medical personnel, adequate supply of life-saving drugs, maintenance of a certain degree of cleanliness etc. It may also be necessary to explore how Private-Public Partnerships can be effectively utilized.

Apart from health care infrastructure and its accessibility, problems relating to maternal and child health also require serious attention, particularly in view of their implications for subsequent generations. These problems cannot be solved through a ‘top-bottom’ approach, but require building community awareness and involvement. NGOs can play an important role in this respect. The ICDS also has a major potential role. Gram panchayats have
to be involved more actively. The scarcity of Female Health Assistants and trained Dais, and their non-availability in the locality on a 24-hour basis are institutional impediments to improving the situation with respect to maternal health. This problem must be addressed by the Health Department. The state Government must also realize the economic importance of health and release financial resources accordingly.

There must also be regular review and evaluation of existing programmes in the area of child and maternal health. Unfortunately, the lack of a Universal Surveillance Data System renders the task of evaluation difficult. This is an institutional reform that should be given high priority by the State.

Sundarban blocks – specifically the island blocks - are very vulnerable to natural disasters. Idiosyncratic risks arising from embankment damages are on the rise despite huge mitigation expenditures. Conditions of Basanti and Gosaba are fast deteriorating. Community institutions for collectively managing embankments are missing in Sundarban. The building up of such institutions for embankment management and linking them with other government programmes to provide the proper incentives may help people in more effectively coping with embankment erosion. After all, the mud embankments for the islands were built and maintained for decades by the ancestors of the present population. Thus the effective use of the indigenous technology and local knowledge of the rivers and the tides may actually help in sustaining the ecological balance. The forest protection committees and eco development committees should be involved in creating mangrove cover for the embankments which is absolutely essential for sustenance.

Even among thirteen Sundarban blocks, Basanti, Gosaba, Kultali, Patharpratima and Sagar should be treated differently from the others. These blocks are primarily island blocks with hardly any surfaced road network and electricity for the majority of areas. Recently, there has been some improvement in mainland connectivity in Basanti and Kultali with building of a couple of bridges, but overall the situation is still grim. The poor state of infrastructure in the island blocks has increased the people’s forest dependence in absence of alternatives. As a result, the ecological balance in Sundarban – a UNESCO World Heritage Site – gets adversely affected. The stakes here are much higher. The development of livelihoods in these blocks is essential for sustainability of Sundarban. The funds required need to be provided by the State.
and the Central Governments. Even global funding may be arranged in conserving the Sundarban in a sustainable way. The role of the Non Governmental Organizations must be recognized and they may be given a space to work side by side the state agencies in this endeavour.

Given the limited resources at the disposal of the state, involvement of NGOs and other civil society organisations in the process of human development becomes inevitable. In South 24 Parganas, NGOs have a long history of working side by side the state in extending development to the most vulnerable. The Tagore Society for Rural Development started its operation in Rangabela island of Gosaba in 1969 and its success in changing the scenario of the village is internationally recognized. In recent times, a very large number of NGOs have begun functioning in the district particularly in the fields of disaster relief, and capacity building in health and education. Trafficking of women and high incidence of child labour are two areas of real concern for the district. The NGOs have played a commendable role in addressing these issues. The NGOs are also involved in building of social consensus against dowry and child marriage practices, as well as in the rehabilitation of victims of crimes against women, with minimal funding support from the state. There is nevertheless considerable social space for the involvement of NGOs in evaluation and monitoring activities relating to the developmental programmes administered by the Panchayats and the State Government and in building and nurturing community groups like forest protection committees and eco development committees in Sundarban areas.
